CHAPTER 7 – LIMPOPOPROVINCE

Provincial Best Performer

Polokwane Local Municipality is the best performing municipality in Limpopo Province:

✓ 92.61% Municipal Blue Drop Score

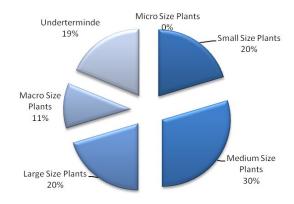

♦ LIMPOPO Page 1

Introduction

Water services delivery is performed by eleven (11) Water Services Authorities in Limpopo via 64 drinking water supply systems. Magalies Water and Lepelle Northern Water Boards are the main Water Services Providers in Limpopo that abstract and treat raw water and supply treated water in bulk to the municipal networks. The Blue Drop results are therefore also a reflection of the Water Board's performance as bulk provider.

Distribution of Water Supply Systems in Limpopo

A total design capacity of 803.4 is available for drinking water supply in Limpopo Province. Distribution of drinking water takes place via 64 supply systems. Operational data is not available for all systems and the table below assumes an average operating capacity of 80% (of systems design capacity), where data is not available. This result in an average output volume (final water) of 670 Ml/day.

	MICRO SIZE <0.5 M&/day	SMALL SIZE 0.5-2 M&/day	MEDIUM SIZE 2-10 M&/day	LARGE SIZE <10-25 M&/day	MACRO SIZE >25 M&/day	Undeter- mined	Total
No of Water Supply Systems	0	13	19	13	7	12	64

Average Operating Capacity (%)	0	96.5	84.4	75.1	77.7	NI	83.4
Output volume (Mℓ/day)	0	14.2	82.3	166.3	364.8	NI	670.2

N/A = Not Applicable NI = No Information

Provincial Blue Drop Analysis

Analysis of the Blue Drop assessments and site inspection results indicate that performance vary from excellent to unsatisfactory. The municipal Blue Drop results vary from a low of 14.3% to a high of 92.6%. A total of 100% municipalities were assessed during the 2010/11 Blue Drop Certification.

BLUE DROP COMPARATIVE ANALYSIS							
Performance Category	2009	2010	2011	Performance trend			
Inc	centive-based in	ndicators					
Number of municipalities assessed	6 (of 11) (54.5%)	11 (of 11) (100%)	11 (of 11) (100%)	↑			
Number of water systems assessed	37	64	64	→			
Number of Blue Drop scores ≥50%	17 (45.94%)	26 (40.62%)	29 (45.31%)	1			
Number of Blue Drop scores <50%	20 (54.05%)	38 (59.37%)	35 (54.69%)	1			
Number of Blue Drop awards	0	3	5	↑			
PROVINCIAL BLUE DROP SCORE	54.33%	79.4%	77.33%	N/A			

N/A = Not applied

 \uparrow = improvement, \downarrow = digress, \rightarrow = no change

A total of 64 systems were assessed during both the 2010 and 2011 assessment cycles, respectively. Readers must be mindful that smaller systems have collapsed into centralised systems or larger systems may have divided into various smaller supply systems. The Department is tracking these changes diligently to ensure that all systems are continuously being monitored.

The 100% assessment coverage serves to affirmation the continued commitment by Limpopo municipalities and the Water Boards to provide reliable and uninterrupted water supply to consumers.

Unfortunately, the results indicate that some municipalities need urgent attention in terms of their water quality and management aspects to live up to this expectation.

Despite the isolated pockets of poorly performing municipalities in the Province, the overall impression is one of commitment to the Blue Drop process by the submission of Portfolios of Evidence that are improving with each assessment year. Municipalities seems to use the process to continuously renew operational baselines and reprioritise plans with the primary objective of raising the current performance status in terms of municipal drinking water

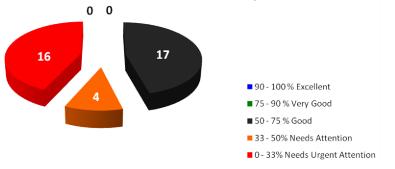

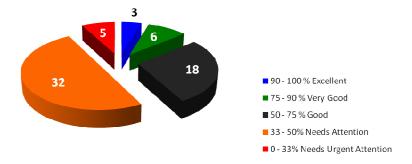

quality management. The incentive-based regulatory approach succeeds to act as a positive stimulus to facilitate improved performance and public accountability, whilst establishing essential systems and processes to <u>sustain</u> and <u>measure</u> gradual improvement. The trends analysis indicates that Limpopo is succeeding to slowly but methodically improve its Provincial Blue Drop score over time. The provincial scores increased from 40.8 (2009) to 54.9 (2010) to 64.0% in 2011.

Whereas only 3 systems obtained Blue Drop scores ≥50% in 2010, 5 systems obtained >50% in the 2011 Blue Drop cycle. In addition, the number of systems scoring between 75 – 100% increased from 0 (2009) to 9 (2010) to 20 in 2011. The pie diagram hereunder illustrate that the systems in critical condition (red and orange) are moving from its dominant position (>50%) to a lesser position of 51%. Expectations are that the Province will break the water shed during 2012 whereby a significantly lower portion of systems will reside in the red/orange space.

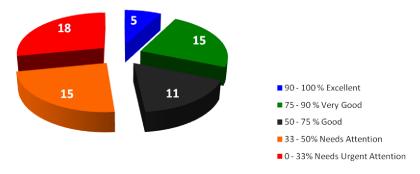

♦ LIMPOPO Page 3

Blue Drop Assessment Results: 2011

When comparing 2011 Blue Drop results with 2009 and 2010, the following trends are observed:

- √ 64 systems are assessed in 2011 compare to 64 (2010) and 37 (2009)
- ✓ 5 systems achieved Blue Drop Certification, compared to 3 (2010) and 0 (2009)
- x 31.3% of all systems are now in excellent and very good state (2011) compared to 14% of systems (2010) and 0% (2009).

Readers need to be mindful that Blue Drop Certification follows a regulation strategy that facilitates **gradual and sustainable improvement....** Thereby, Blue Drop requirements become more stringent with every assessment cycle. Municipalities who merely 'maintained' their water on same levels year in and out, is likely to achieve reduced Blue Drop scores, whilst municipalities that drive 'continuous' improvement, are likely to be awarded with improved Blue Drop scores with each assessment cycle.

Conclusion

The Blue Drop results for 2011 indicate that municipal drinking water quality management in Limpopo vary from excellent to unsatisfactory, with 18 systems that need urgent attention. The overall business of drinking water supply and quality management for the Province is not on standard as yet, although pockets of excellence are certainly evident.

Five Blue Drop Certificates are awarded in Limpopo:

• 1 Blue Drop : Modimolle Local Municipality / Magalies Water

2 Blue Drops : Mopani District Municipality / Lepelle Water and Greater Tzaneen Local

Municipality

• 2 Blue Drops : Polokwane District Municipality / Lepelle Water

Polokwane Local Municipality Capricom District Municipality Lephalale Local Municipality Modimolle Local Municipality 저 Mogalakwena B Local Municipality □ Bela Bela Local Municipality 8 Mopani District Municipality Greater Sekhukhune Whembe District Municipality Mookgopong Local Municipality Thabazimbi Local Municipality

Chemical Compliance(12 months)	99.79%	92.31% (7 months)	75.00% (6 months)

Regulatory Impression:

The regulator is most optimistic regarding the continued improvement of the drinking water quality (DWQ) management performance of the municipality. The improved Bela Bela supply system Blue Drop score, together with the presentation of more supply systems for evaluation, are testimony that Bela Bela could, with the appropriate resources and focus, effect further positive changes to their DWQ management performance. DWQ failures at the Radiam and Rapotokwane boreholes however require immediate attention to protect public health. Water in Radiam is of unacceptable microbiological and chemical quality, fluoride failures in Rapotokwane infer non-compliance to national legislation for chemical drinking water quality (SANS 241).

The municipality should target to complete their water safety plan addressing risks in all the supply systems, municipal management should thereafter show support by making budget available to implement control measures. Disinfection as a control measure should immediately improve in all the supply systems. Other gaps to address include process control and asset management at the borehole systems.

Findings

Magalies Water, water services provider in the Bela Bela supply system, should improve information submission on the Blue Drop System (BDS). DWA received no evidence of a water safety plan, compliance with Regulation 2834 or asset management. Final water from the Klipdrift treatment plant was evaluated of poor microbiological quality and although of excellent chemical compliance, the fluoride failures reported in the final water

♦ LIMPOPO Page 7

continued to be a problem within the distribution network. Magalies Water must improve disinfection.

Information is still outstanding from the WSA to ensure BDS credibility of all DWQ data.
 BDS data credibility implies that the municipality supplied DWA with all the information needed to confirm the accuracy of results. This implies amongst others, date of analyses, laboratory performing the analyses and method used to obtain the result.

Water Services Authority: Capricorn District Municipality
Water Services Providers: Capricorn DM; Lepelle Water

Microbiological Compliance(12 months)	100.00% (6 months)	97.80%
Chemical Compliance(12 months)	94.44% (1 month)	99.79% (2 months)

Regulatory Impression:

The Department commends the performance of Capricorn during this Blue Drop assessment period. The municipal officials were well prepared and found to place the required value to improve drinking water quality (DWQ) management within the 2 evaluated supply systems. DWQ in the Mashashane system, reported in 2010 to pose an unacceptable risk to consumers due to microbiological failures, were with sufficient monitoring data confirmed to be safe for human consumption. DWA encourage the municipality to maintain the performance ensuring that the monitoring programmes are maintained. Submitting information on the Blue Drop System (BDS) required to access credibility of results, as well as improved communication to constituents could see the municipality on its way to Blue Drop status.

Lepelle Water, Water Service Provider within the Olifantspoort supply system, provided with the municipality the required information to also confirm outstanding performance in the Olifantspoort system. The WSA and WSP should continue the good relationship and performance.

DWQ within Olifantspoort was evaluated as having good microbiological and chemical quality. Fluoride levels in excess of the national drinking water standard (SANS 241), reported by Capricorn in the distribution network, raises some concern. While the WSP conducted a full SANS 241 analyses only once a year as minimum requirement of SANS 241, a similar failure was not detected. The WSA and WSP should therefore investigate the deterioration of water quality from the treatment plant to the distribution network, also determining the duration of the failures. Findings will determine the need for control measures.

On further evaluation of the Blue Drop System (BDS), apart from the supply systems presented for evaluation, DWA noted 19 other supply systems. Varying quantities of E. coli, fluoride and sulfate data

♦ LIMPOPO Page 9

had been loaded against these systems. Of the total Capricorn population (535 256), the 2 assessed systems represents the quality of service provided to 117 517 inhabitants, service delivery to 417 739 people is thus assumed unknown. Capricorn should explain to DWA within 30 days why so many unassessed systems appear on BDS.

Report cards were not prepared for the zero Blue Drop scores calculated for the Boskloof, Nkosini and Sekhukhune supply systems

Regulatory Impression:

From a regulatory point of view, drinking water quality (DWQ) management services by Greater Sekhukhune District Municipality presents a high risk situation to public health. The Department of Water Affairs has to express concern since the microbiological quality of water in 6 of the evaluated 11 supply systems shows non-compliances with the South African standard for drinking water (SANS 241). While the municipality and service providers maintained the required monitoring for 12 months in only 4 supply systems, available chemical data further confirmed risks of irreversible health effects in one of the supply systems. The WSA and WSP's has to urgently improve the quality of water supplied to residents, DWA has to be furnished with information within 30 days to confirm how the municipality intends on improving disinfection as control measure.

Other prominent areas of concern include the lack of water safety plans in supply systems under full control of Sekhukhune. DWA encourages the municipality to speedily complete risks assessments, thereafter a risk-based approach should be followed to prioritise monitoring and implementation of control measures. Municipal management should take the lead in improving the situation, staff should be guided in the development and implementation of appropriate management processes informed by the water safety planning process. To improve asset management, identified as another area requiring immediate improvement, funds must be made available to complete process optimisation audits and acquire calibrated flow meters as a start.

DWA requests the municipality in conclusion to ensure proper registration of water supply systems on the Blue Drop System. Boskloof and Sekhukhune presented for evaluation are not registered as supply systems on the BDS, 15 other water supply systems, not presented for evaluation, however appears on BDS with no data loaded against the systems.

Water Services Authority: Lephalale Local Municipality

Water Services Providers: Exxaro *; Eskom*

Municipal Blue Drop Score 2011: 82.63%

Population Served by System	20 373	15 000
Ave. Daily Consumption per Capita (I)	>500	>500
Microbiological Compliance(12 months)	100.00%	100.00%
Chemical Compliance(12 months)	100.00%	100.00%

Regulatory Impression:

Lephalale Local Municipality presented 2 supply systems for the 2011 Blue Drop assessment. Water Service Providers (WSP's) assists the municipality in both systems with drinking water quality (DWQ) service delivery. EXXARO acts as WSP in the Zeeland system, while ESCOM maintain function in the Matimba system. On further evaluation of the Blue Drop System (BDS), neither system was found registered under the municipality. As a result DWA could not verify performance of the municipality within the 2 supply systems, drinking water quality (DWQ) data submitted by the WSPs were consequently used to evaluate compliance. In future, DWA requires a service level agreement wherein the WSP's and the WSA agrees that the respective service providers takes full responsibility for the provision of drinking water, if not submitted, DWA will apply a penalty for the lack of the municipality to take accountability.

BDS confirms 37 supply systems registered under Lephalale, most appear as borehole systems, none was however presented by the municipality for evaluation. E. coli and varying quantities of chemical determinand data had been loaded against most of the systems. Lephalale should confirm correctness of the supply systems on BDS, DWA should thereafter receive information to confirm that all residents within the municipal area receive drinking water of a quality meeting the requirements of the South African standards (SANS 241).

♦ LIMPOPO Page 13

Findings

- Blue Drop scores confirm drinking water of excellent quality in the Zeeland system. DWA
 has confidence that EXXARO and Lephalale can maintain the service, the WSA and WSP is
 encouraged to improve aspects such as credibility of the DWQ results in an attempt to
 attain Blue Drop status. EXXARO should maintain all aspects of performance, monitoring in
 particular was noted exceptional.
- While service delivery by ESCOM and Lephalale also deserves to be applauded by DWA, gaps such as poor credibility of DWQ results and asset management prevented DWA from acknowledging excellence. ESCOM should improve these aspects, while DWA encourages the WSP to maintain the comprehensive compliance monitoring programme.

Regulatory Impression:

The Department commends ModimolleLocalMunicipality and Magalies Water with the excellent performance in the management and operations of the Modimolle water supply system which qualifies for Blue Drop Certification status. The Department wish to encourage the Municipality to not rest on its laurels but to ensure that all possible is done to maintain or improve performance. It has to be noted that the municipality and Magalies Water needs to maintain the monitoring programmes registered on the Blue Drop System (BDS). Although DWA accessed the compliance of the supply system against a compliance calculated from all available data, microbiological compliance at both the Klipdrift and Donkerpoort treatment works infers that treatment at both systems require optimisation. Disinfection needs to be closely monitored to confirm continuous disinfection of the water supplies.

Sadly, the performance of ModimolleLocalMunicipality was not duplicated in the Mabaleng and Mabatlane water supply systems. The situation demands the attention of the municipal administration and governance, the Regulator trusts that the poor performance against the Blue Drop evaluations will motivate the municipality to immediately commence monitoring of drinking water supplies in these two systems, while other areas of performance also improve.

Regulatory Impression:

The Department commends Mogalakwena Local Municipality and Lepelle Water Board with the improved drinking water quality (DWQ) management performance in the Doorndraai water supply system. Although the service level agreement confirms that Lepelle Water Board takes responsibility for the service, the municipality remains accountable for the quality of the service and should therefore ensure that the stay abreast of the situation.

DWQ management practices of Lepelle Northern Water mostly appeared compliant with the requirements of the regulatory programme. The WSP was well prepared for the evaluation. Data submission confirmed that both the WSA and WSP maintain comprehensive microbiological compliance monitoring programmes. Chemical monitoring was mostly evaluated compliant with the minimum monitoring requirements of the national drinking water standard (SANS 241). DWA applauds the WSA and WSP for improving monitoring as requested in the 2010 Blue Drop Report.

Excellent DWQ from the treatment plant unfortunately deteriorated within the distribution network to the point that the water posed a risk to public health. Mogalakwena and Lepelle should investigate reasons for the microbiological non-compliances. Disinfection needs to improve, distance between the treatment facility and points of use could warrant secondary disinfection within the distribution network as control measure. Non-compliance with the microbiological standard for drinking water appeared to be the main requirement from the previous assessment not satisfactorily addressed. It is now required that municipal management provides leadership in the turn-around of this unwanted situation.

Findings

- On further inspection of the Blue Drop System (BDS), DWA noted two supply systems registered under Mogalakwena. Evidence submitted to DWA appears mostly against the one system, DWA requires that the WSA confirms the need for both systems. Data either needs to appear under only one system to correlate with the number of systems presented for evaluation, alternatively, both systems should be evaluated in future.
- Other areas requiring attention of the municipality include verification that monitoring of the distribution network represents 80% of the supply network, while efforts also ensue to ensure credibility of all data submitted by the municipality.

Blue Drop Score (2010)	44.88%
System Design Supply Capacity (MI/d)	1.6
System Operational Capacity	100%
Population Served by System	25 000
Ave. Daily Consumption per Capita (I)	6
Microbiological Compliance(12 months)	90.00% (9 months)
Chemical Compliance(12 months)	100.00% (1 month)

Regulatory Impression:

Unfortunately, the Blue Drop score indicate that drinking water quality (DWQ) services within Welgevonden are still not on par with the requirements of the regulatory programme. Reports by the WSA however imply that with municipal support, the performance of the municipality will show future improvement. DWA is encouraged to note that the municipality, assisted by a service provider, intends to re-draft their water safety plan while also conducting a full SANS 241 (South African standard for drinking water) analyses on the drinking water supplies. Areas of concern within the water safety plan are however listed below.

In general, one of the key challenges faced by the assessment team was the lack of documented proof to verify assertions made by the WSA to improve compliance. The lack of DWQ data and other performance information on the Blue Drop System (BDS) consequently hampered DWA's ability to verify performance and scoring of Mookgopong. DWA furthermore noted that the WSA mentioned the hazard of ever-experiencing water supply shortages as a critical risk, plans to address the problem, including the upgrade of the treatment system should be submitted to DWA. The municipality is in addition required to compile and submit a portfolio of evidence on their Blue Drop performance to ensure a better platform from which to access their DWQ service.

Findings

- The Water Safety Plan does not indicate the risk prioritisation method. All risks (i.e. ability of the works to treat water to comply with SANS 241) cannot be confirmed considered / addressed until such time that the municipality conducts a full SANS 241 analyses on the raw and final water. Risks such as financial constraints, process controller availability, power failures amongst others, are not listed. Other areas of the water safety plan to improve include more specific detail on roles and responsibilities, proof of municipal commitment and the availing of budget to implement findings.
- DWA received no evidence of a DWQ Incident Management Protocol or DWQ Incident Register.
- Treatment system and process controller classification as per requirement of Regulation 2834 needs to be finalised on BDS. Operational and maintenance procedures must be available to ensure continued operation of the plant, the importance of an O&M manual increase with the age of the plant.
- DWA requires proof of operational monitoring. The programme should be registered on BDS, log sheets will serve as proof of implementation.
- Monitoring needs to improve to ensure uninterrupted 12 months of microbiological data.
 Chemical compliance monitoring needs to be verified inclusive of all potential risks.
- Lastly, Mookgopong needs to urgently address the lack of asset management, this includes an annual process audit and improvements to the asset register to include aspects such as remaining life and replacement value.

Regulatory Impression:

MopaniDistrictMunicipality, as Water Services Authority, is responsible for 15 water supply systems. In general, the 2011 Blue Drop performance against systems managed solely by Mopani however instil no confidence that the responsibility is executed with the level of efficiency required to ensure continuous supply of safe drinking water. Water in many of the supply systems (Giyani, Nkuri / Mapuve, Tours, Nkambako and Nondweni) has been evaluated to pose a risk of infection to consumers. Conservatively, DWA also has to regard the water of unacceptable quality in other systems not monitored by the municipality (Zava and Thabina).

Information needs to be submitted to the DWA within 60 days to confirm address of the microbiological water quality non-compliances. The situation demands that municipal administration and governance takes leadership in ensuring turn-around of the unacceptable situation. DWA needs to be convinced that municipal staff who showed no interest in attending the Blue Drop assessments will take lead to ensure that people within the municipal area of jurisdiction is protected from risk of infections.

On a positive note, the Department commends Lepelle Water Board and TzaneenLocalMunicipality with the excellent performance in the management and operations of the Tzaneen and Letsitele water supply system which respectively qualifies for Blue Drop Certification status. The Department wish to encourage the Municipality to not rest on its laurels but to ensure that all possible is done to maintain or improve the quality of service to consumers.

Regulatory Impression:

The Department commends the performance of PolokwaneLocalMunicipality, assisted by Lepelle Northern Water during this Blue Drop assessment period. Officials from both the WSA and WSP were truly well prepared and found to place the required value to ensure that the municipality provides residents within the municipal area with drinking water quality (DWQ) management services of excellent quality. The definitive laudable feat would therefore be that DWA can award the Polokwane with Blue Drop Certification in 2 water supply systems (PolokwaneCity and Mankweng). The Department wish to encourage the Municipality to not rest on its laurels but to maintain the performance and supply of drinking water safe for human consumption.

Regulatory Impression:

The lack of accountability and passivity by Thabazimbi Local Municipality in terms of its drinking water quality (DWQ) management services is deplorable. The municipality provided almost no evidence in support of good services delivery and performance within its area of jurisdiction. The absence of Magalies Water, water services provider in the Greater Thabazimbi supply system, as well as the lack of information on the Blue Drop System (BDS) prevented a thorough evaluation of work done by the WSP in the Thabazimbi system (the latter noted the largest in terms of population).

From a regulatory point of view, poor DWQ presents a high risk situation to public health. As a result, the Department of Water Affairs expresses a zero confidence level in the municipality's ability to render a safe and sustainable DWQ service. The failure to improve drinking water quality which already posed a risk to consumers in 2010 now becomes critical. Disinfection, as shown by the low free available chlorine levels, but more importantly the continuous actual detection of microbiological pollutants in almost all the water supply systems, put people at risk of diarrhoeal diseases. Furthermore, data confirms unacceptable continued levels of fluoride in excess of the South African national standard for drinking water (SANS 241).

The WSA should provide the Department with information within 60 days to confirm that the microbiological water quality failures reported in almost all the supply systems had been addressed. Action plans should indicate planning to immediately improve disinfection, long-term planning should focus on applying treatment effective to render water of safe chemical quality. Municipal management must ensure immediate turnaround. Disciplinary action should be taken against staff failing to fulfil their duties.

Other prominent gaps in the current performance include poor process control, the lack in quality assurance at the laboratory which compromise the credibility of results, as well as the lack of performance publication and asset management.

Findings

- Monitoring, in particular the number of determinands tested, is probably one of the aspects of the Thabazimbi DWQ management services that earns praise from the Department. As per legal requirement, the WSA however failed to maintain microbiological monitoring for 12 months.
- The increase in registered supply systems further imply that the DWA could perform a more focussed, system specific assessment which allows for improved identification of problem areas.

Regulatory Impression:

The 2011 Blue Drop scores indicate that drinking water quality (DWQ) management services are yet to be on par with expectations of the regulatory programme. The consolidation of 26 water supply systems into 12 is however seen as a positive step towards a more focussed approach for DWQ management. DWA is also encouraged to note that system specific information was available on the Blue Drop System (BDS) to evaluate actual DWQ in almost all the supply systems.

Although monitoring still has to improve to ensure at least 12 months of microbiological data for each of the supply systems, available data confirm that DWQ in the Elim, Makhado, Musina, Mutale, Mutshedzi, Tshedza and Tshifhire systems are of excellent microbiological quality. DWQ in the Kutama and Malamulele systems demand the immediate attention of the municipal administration and governance, water within the systems poses a risk to public health. Disinfection needs to be optimised immediately. The complete lack of monitoring data for the Musekwa and Nzhelele systems makes it impossible to evaluate DWQ compliance, from a conservative perspective, DWA has to assume that water within these systems also pose a risk to public health. Monitoring must commence immediately, while the WSA verify that all determinands of concern are included in the chemical-health compliance monitoring programme. DWA requires proof of a full SANS 241 analyses at least annually in the supply systems.

Findings

- The Water Safety Plan needs to improve to cover all the supply systems. Other aspects
 requiring improvement include a more thorough assessment of risks, inclusion of a risk
 prioritisation method, while a full SANS analysis of raw and final water has to be conducted
 to confirm the capability of the various treatment systems to address all contaminant
 possibilities (latter needs to be outsourced if the municipal laboratory can't perform all the
 analysis). Without management support and availing of budget, DWQ management
 services will never adhere to all the requirements of satisfactory performance.
- 2. DWA received no evidence of a DWQ Incident Management Protocol or Register.
- Treatment system and process controller classification as per requirement of Regulation 2834 needs to be finalised on BDS.
