CLASSIFICATION OF SIGNIFICANT WATER RESOURCES AND DETERMINATION OF RESOURCE QUALITY OBJECTIVES FOR WATER RESOURCES IN THE USUTU TO MHLATHUZE CATCHMENTS (WP11387)

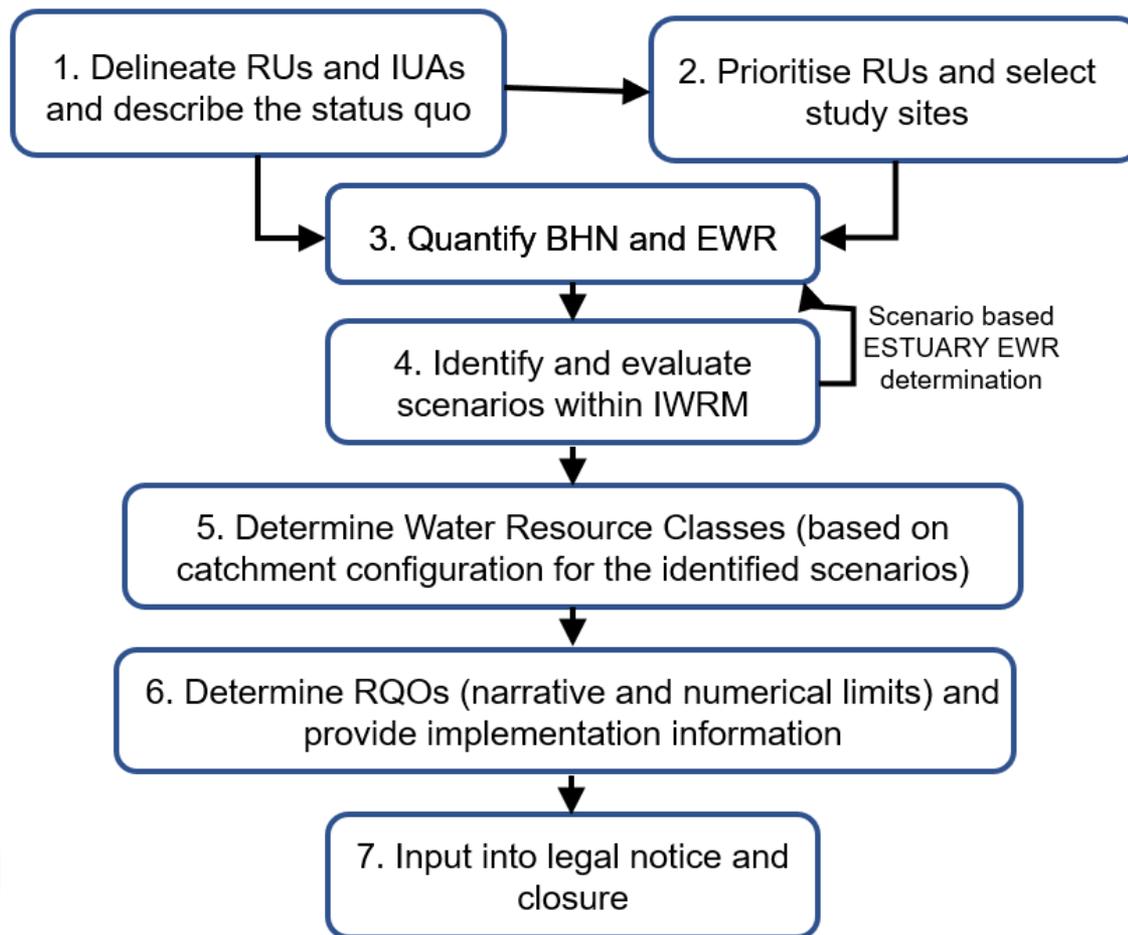

PUBLIC MEETING, RICHARDS BAY: 4 MAY 2022

WATER IS LIFE - SANITATION IS DIGNITY

4.1 STUDY APPROACH

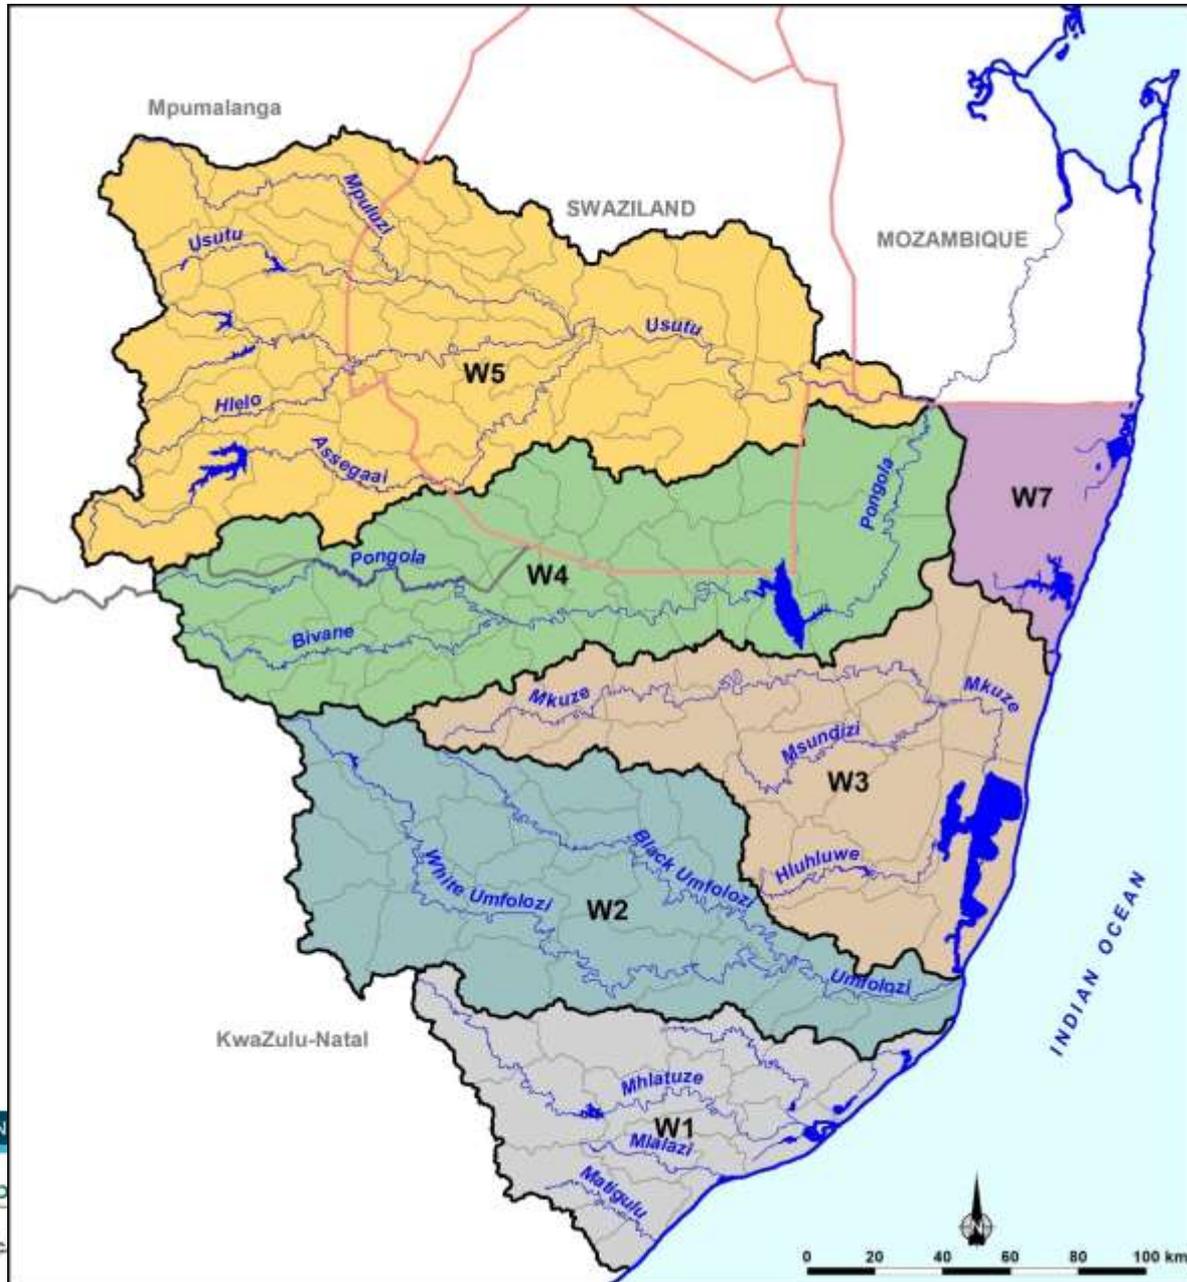

The Study Plan is broken down in tasks and based on the integrated approach for Water Resource *Classification, Resource Quality Objectives (RQOs)* and the Reserve

INTEGRATED WATER RESOURCE MANAGEMENT

- **Resource Directed Measures**
 - Measures that focus on the quality of the resource itself, i.e. ecological state
 - **Classification, RQOs, Reserve**
- **Source Directed Controls**
 - Measures designed to control water resource activities at the source of impact, e.g. discharge standards and license conditions

4.2 SCOPE OF WORK

Technical tasks (see next slides) according to the Study Plan / Integrated Framework

TASK 1 AND 2: STATUS QUO, IMPORTANCE AND PRIORITIES, DELINEATION INTO UNITS

- How do we divide the study area into manageable units, i.e. Delineation?
 - **Primary Catchment W consisting of six secondary catchments: W1, W2, W3, W4, W5, W7**
- What is the status of these units in terms of water resources, ecology, economy, social, water quality etc., i.e. Status Quo?
- How important (from various perspectives) are these units?
- How do we prioritise these units to know where to do detailed work – given the large study area, i.e. Prioritization + Site selection?

STEPS 1 AND 2 (cont.)

Actions:

- Study area is delineated into Sub-quaternary Reaches (SQRs). Desktop **Present Ecological State (PES)** for each (reviewed during this study) and **Ecological Importance + Sensitivity (EIS)** is available for each SQR.
- Delineation 1: Group SQRs into **Resource Units (RUs)**. Resource Units are the scale at which all evaluations are undertaken.
- Group RUs into **Integrated Units of Analysis (IUA)**. Each IUA consists therefore of RUs and this represents an IUA and its Catchment Configuration.
- All information captured in a working spreadsheet which forms the basis of all classification results.

STEP 3: BHN AND EWR

- What are the discharge and quality required to achieve a certain ecological state in rivers, wetlands, and estuaries, i.e. **ecological water requirements (EWR)**?
- How many persons do not have access to piped water or water from boreholes? Calculate a range of **basic human needs (BHN)** allocations.

Actions

EWRs

- Reserve study undertaken (2014).
- River results (eight EWR sites) will be used and adjustments made where required .
- Desktop model will be used to provide desktop estimates for RUs not represented by EWRs.
- Estuaries and wetlands will also use results from previous studies and review where required.

STEPS 4 AND 5: OPERATIONAL SCENARIOS, CONSEQUENCES, PROPOSED CLASSES

- What future water resource developments or related developments (**development scenarios**) are planned that could effect the status quo; and how?
- How do we manage (operate) our water resources to balance use considering impacts?
- How do we manage our current water resources to possibly reach an improvement in the environmental / ecological status in certain areas, if required?
- Which of these scenarios are acceptable for Classification?
- What are the **Target Ecological Categories (TECs)** associated with the accepted scenario?

STEPS 4 AND 5 (cont.)

Actions

- Identify a range of scenarios in those systems where one has detailed EWR information available.
- Test the range with stakeholders.
- Model the scenarios and provide the consequences on state in terms of ecology, economy, socio-economics.
- Develop an **optimised scenario** to maximise yield and have minimal impacts on socio-economics and ecology, and improve states where necessary.
- Present to stakeholders.
- Recommend an **operational scenario** considering the implication on the ecological state.
- Provide the **Target Ecological Categories (TECs)** (*catchment configuration*) and associated **Water Resource Classes** for the accepted operational scenario.

STEP 6: RESOURCE QUALITY OBJECTIVES

- **How do you determine whether you are complying to the Class and the TECs?**
- **What do you measure to determine whether you are complying?**
- **How do you operate/implement to determine whether you are complying?**

Actions

- **Define (quantify and quality) the TECs for high priority RUs in terms of RQOs.**
- **Provide a monitoring programme on how to measure and implementation information.**

DELIVERABLES (1 OF 2)

- **Basic Human Needs**
- **Groundwater**
- **Estuary**
- **Wetland**
- **Ecological Water Requirements**
- **Scenario Descriptions**

DELIVERABLES (2 OF 2)

- **Consequences**
 - **Rivers**
 - **Estuaries**
 - **Ecosystem Services**
 - **Water Quality**
 - **Economics**
- **Water Resource Classes Report**
- **Resource Quality Objectives**
 - **Rivers**
 - **Estuaries**
 - **Wetlands**
 - **Groundwater**

OTHER ASPECTS

- **Training and Capacity Building**
- **Management**
 - **Project Management Committee**
 - **Project Steering Committee**
- **Stakeholder Engagement**
 - **Public meetings**
 - **Technical Task Team meetings, as required**
 - **Sectoral meetings (ad hoc basis)**
 - **Comments register**
- **Input into Legal Notice for gazetting**

4.3 OVERVIEW STATUS OF THE CATCHMENTS: STATUS QUO AND PRIORITIZATION

- Describe the current catchment conditions
- Prioritize catchments from various perspectives:
 - Water Resources (groundwater & surface water)
 - Water Requirements (use for economic activity)
 - Water Quality
 - Socio-economics
 - Goods & services
 - Rivers, wetlands, estuaries

WATER IS LIFE - SANITATION IS DIGNITY

STRATEGIC WATER SOURCE AREAS

Water Source Areas (WSAs) are *natural* places or areas, such as water catchments, which produce disproportionately greater volumes of water per unit area than other areas.

This information feeds into the prioritisation task.

4.4 STUDY PROGRESS

We are
CURRENTLY
working on
these tasks

4.4 STUDY PROGRESS

- **Working on the status quo, compiling all the information, summarising for reports and creating maps.**
- **Use this information to delineate study area in manageable units.**
- **Prioritise the areas.**

The preliminary delineation into Integrated Units of Analysis has been done and this will be provided in the next slides as well as some explanatory background on the terminology used in Classification.

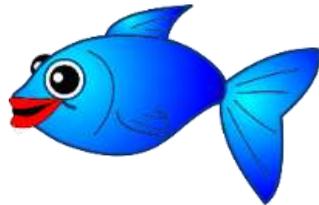

4.5 DELINEATION AND PRELIMINARY INTEGRATED UNITS OF ANALYSIS

To understand what IUAs are and why delineation is required, i.e., the context, we need to remind ourselves of the basics.

What is Classification?

Balance between

Protection
(Ecology)

Expressed as
Ecological state

Use

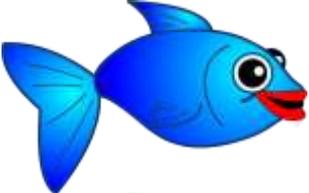

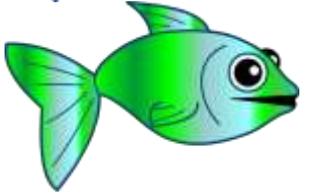

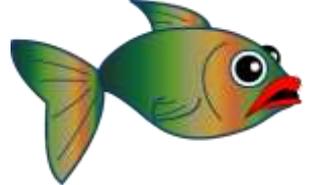

&

includes Water balance,
quality, socio-economics

4.5 DELINEATION AND PRELIMINARY INTEGRATED UNITS OF ANALYSIS (cont.)

How is Classification described as?

Ecology	CLASSES	DESCRIPTION	Use
	I	Ecology: Mostly in good condition Use: Minimal	
	II	Ecology: Mostly in moderate condition Use: Medium	
	III	Ecology: Mostly in poor condition Use: High – work horse river.	

4.5 DELINEATION AND PRELIMINARY INTEGRATED UNITS OF ANALYSIS (cont.)

4.5 DELINEATION AND PRELIMINARY INTEGRATED UNITS OF ANALYSIS (cont.)

What scale do we classify at?

- Classify every Integrated Unit of Analysis. Units are similar to land use &/or ecological state. Very simply put, an IUA consists of many river reaches, wetlands and/or estuaries.
- Provide the Catchment Configuration for every IUA. (Provide the ecological state for each of the river reaches and estuaries, (described as Resource Units(RU) that are within the IUA.

4.5 DELINEATION AND PRELIMINARY INTEGRATED UNITS OF ANALYSIS (cont.)

IUA W21 (Upper Mhlathuze))

- IUA represents a catchment or a linear stretch of river.
- Nested in an IUA are Resource Units.
- Each RU is comprised of a group of similar Sub-Quaternary Reaches (short reaches of rivers for which a PES database exist).
- Each RU represented by a biophysical node – a point for which an Ecological Category is set and EWRs estimated if required.

Water and Sanitation
REPUBLIC OF SOUTH AFRICA

4.5 DELINEATION AND PRELIMINARY INTEGRATED UNITS OF ANALYSIS (cont.)

IUA and catchment configuration definitions.

- **IUA:** Homogenous area that can be managed as an entity.
- **RESOURCE UNITS:** RUs require different EWRS (due to different flow patterns, reaction of habitat and biota to stress, management and operational structures). Although indicated as a catchment on the maps, the RUs are assessed according to the resource (rivers eg) and therefore represent linear sections of rivers for which the Present Ecological State is provided (for the instream and riparian section only)
- **BIOPHYSICAL NODES:** A point in the river which can be a survey site or a hypothetical point ('site'). These are points which are used to assess the Ecological Water Requirements (EWRs).
- **NODES, RUS, IUAS – REPRESENT A CATCHMENT CONFIGURATION WHICH WILL DEFINE OR UNPACK THE CLASS FOR A SPECIFIC IUA**

PRELIMINARY IUAs FOR W PRIMARY CATCHMENT (cont.)

IUAs are preliminary delineations and are still being finalised. The process undertaken for delineation is as follows:

- **Review the ecological state for all the SQRs.**
- **According to similar ecological state, and land use (impacts), group the SQRs into RUs.**
- **Assign a PES to the RUs.**
- **Group the RUs into IUAs to ensure that it represents a homogenous area that can be managed as an entity.**

Next follows the maps illustrating the PRELIMINARY IUAs

PRELIMINARY IUAs FOR W PRIMARY CATCHMENT (cont.)

Secondary	IUA No	IUA Descriptive Name
W1	W11	Matigulu
	W12-a	Upper Mhlathuze
