Department:
Water and Sanitation
REPUBLIC OF SOUTH AFRICA

The Determination of Water Resources Classes and Resource Quality Objectives for the water resources in in the Breede-Gouritz WMA

Agricultural Sector Meeting

24th May 2018
Durbanville

Study Objectives

Co-ordinate implementation of the Water Resources Classification System (WRCS):

- **Determine Water Resources Classes (WRCs)**
- **Determine Resource Quality Objectives (RQOs)**
- **Support Gazetting of Recommended Water Resources Classes and RQOs**

for the water resources in the Breede-Gouritz WMA:

- Rivers
- Estuaries
- Groundwater
- Dams
- Wetlands

Objectives of the Meeting

- Provide overview of:
 - Study progress to date
 - Classification and RQOs Approach
- Present water resource classes and proposed scenario
- Present RQO findings
- Address concerns and clarifications

Overview of Study Process

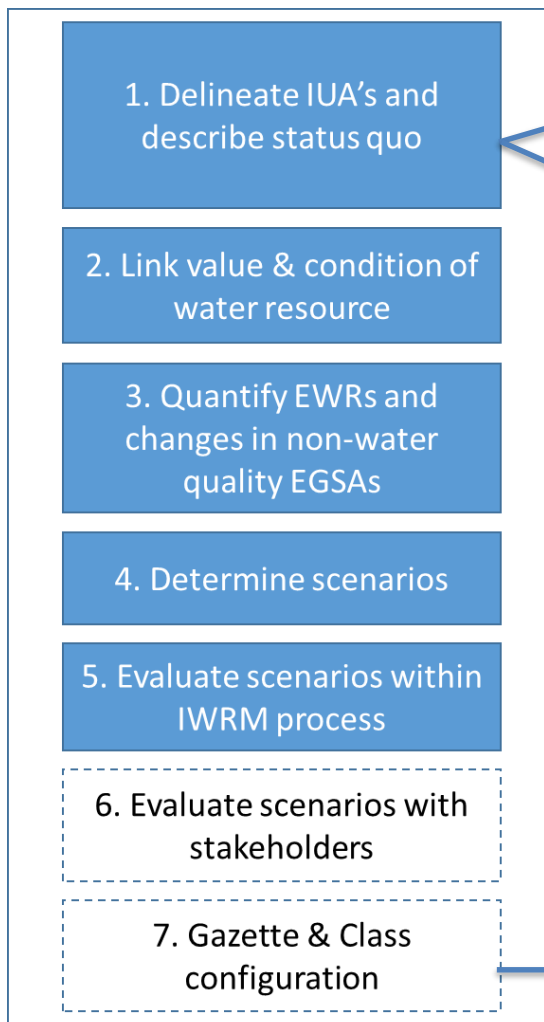

Legal Mandate

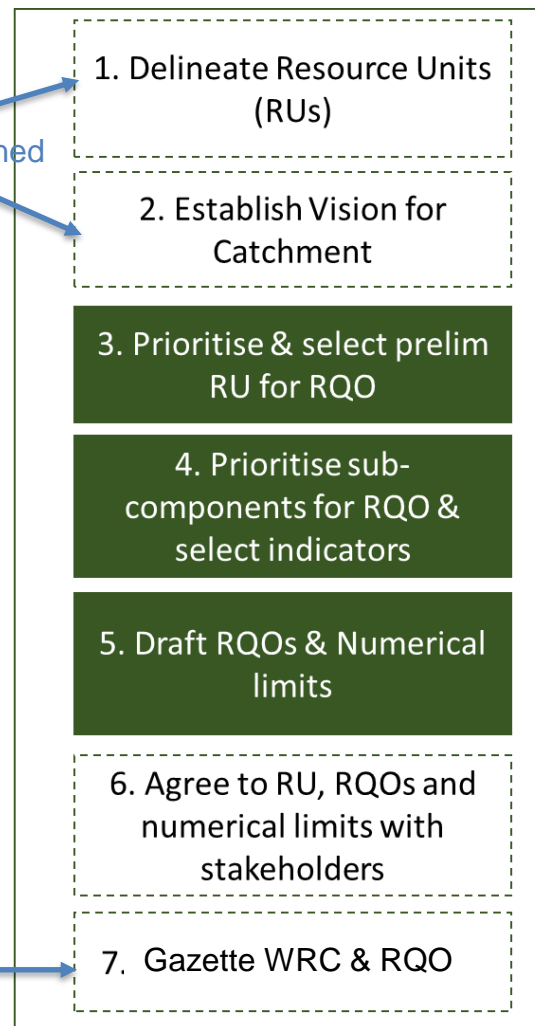

- Chapter 3 of the National Water Act, (No. 36 of 1998) deals with the protection of water resources
- The measures for protection of water resources are:
 - Classification (S13)
 - Resource Quality Objectives (S13)
 - Reserve (S16)
- S12 requires the Minister to establish the Water Resource Classification System, (WRCS)
- WRCS was published as Regulation 810 in Government Gazette No. 33541 dated 17 September 2010
- The WRCS defines:
 - water resource classes and
 - the procedure to determine Class, RQOs and Reserve
- According to the NWA, once the WRCS has been gazetted all significant water resources must be classified and Resource Quality Objectives determined.

Classification and RQOs Steps

7-step process to determine WRCs

7-step process to determine RQOs

Aligned

Stakeholder engagement

- Role of stakeholders is to engage and to provide comment – DWS makes decisions
- Stakeholders are engaged & consulted through SMC meetings, TTG meetings, Sector meetings, & public meetings
- Draft study reports distributed for comment
- Request for this workshop made at TTG meetings

Classification

Defined Integrated Units of Analysis (IUAs)

- Identified **significant resources**:
 - Based on Physical, Biological & Socio-economic factors
- Each IUA represents a similar area requiring a Water Resources Class (WRC)
- Why do we need these?
 - Broad-scale units to assess socio-economic implications of scenarios (*possible future situations*)
 - Report on ecological conditions at a sub-catchment scale
 - Set WR Classes for different parts of a catchment
- 18 IUAs delineated - 10 in the Breede-Overberg & 8 in the Gouritz-Coastal areas

Integrated Units of Analysis

Socio-economic Zone	Zone Code	River Resource Unit	IUA Name	IUA Code
Upper and Middle Breede	A	Upper Breede Tributaries	Upper Breede Tributaries	A1
		Breede Working	Breede Working Tributaries	A2
		Middle Breede Renosterveld	Middle Breede Renosterveld	A3
Upper Riversonderend and Palmiet	B	Riviersonderend Upper	Riviersonderend Theewaters	B4
		Overberg West (part 1 of 3)	Overberg West	B5
Great Karoo	C	Groot/Touws (part 1 of 2)	Gamka-Buffels	C6
		Gamka (part 1 of 2)		
Little Karoo West	D	Lower Gouritz (part 1 of 2)	Gouritz-Olifants	D7
		Olifants

Defined Resource Units (RUs) and Nodes

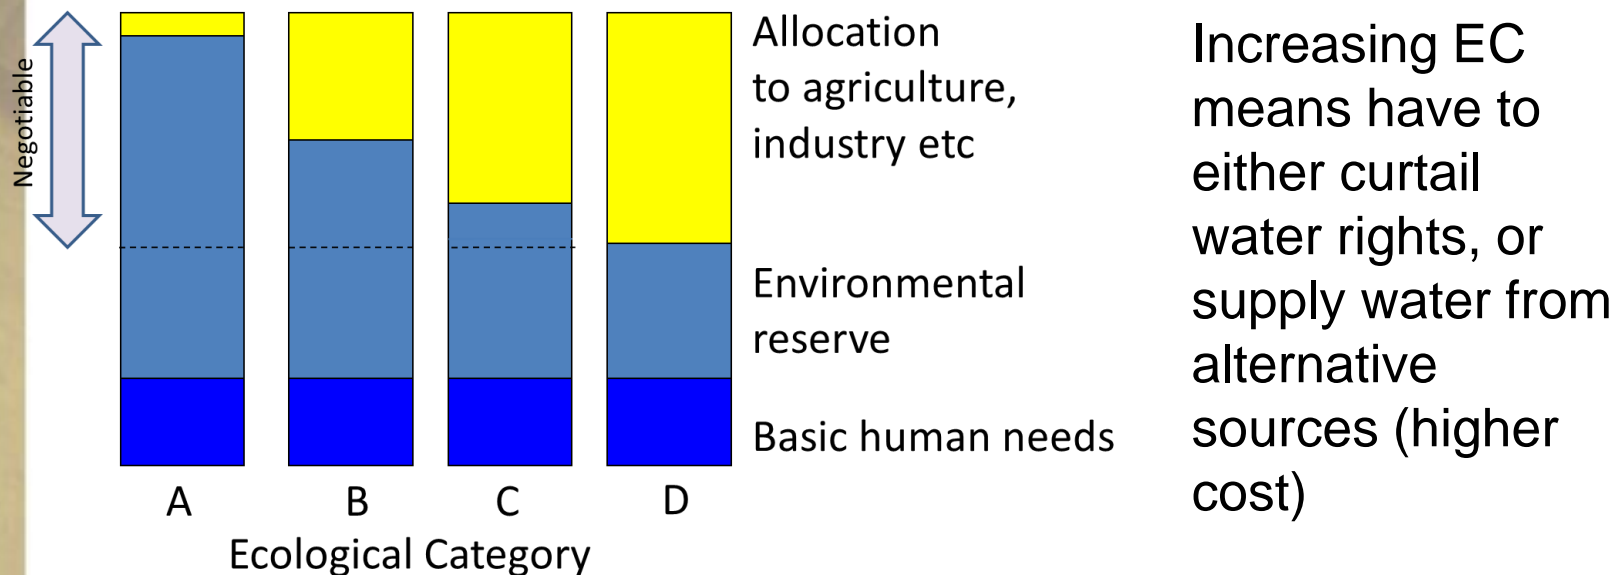

- **Resource units (RUs)** are grouped areas e.g. river basins, deemed similar in terms of various characteristics
- Are used to transfer information between catchments
- Groundwater
- **Nodes** are locations of interest (points) in a water resource (rivers, dams, wetlands, estuaries)
- Are sited using:
 - Water infrastructure
 - Aquatic ecosystem attributes
- Are used to allocate water for environment and development

Socio-economics

Rationale

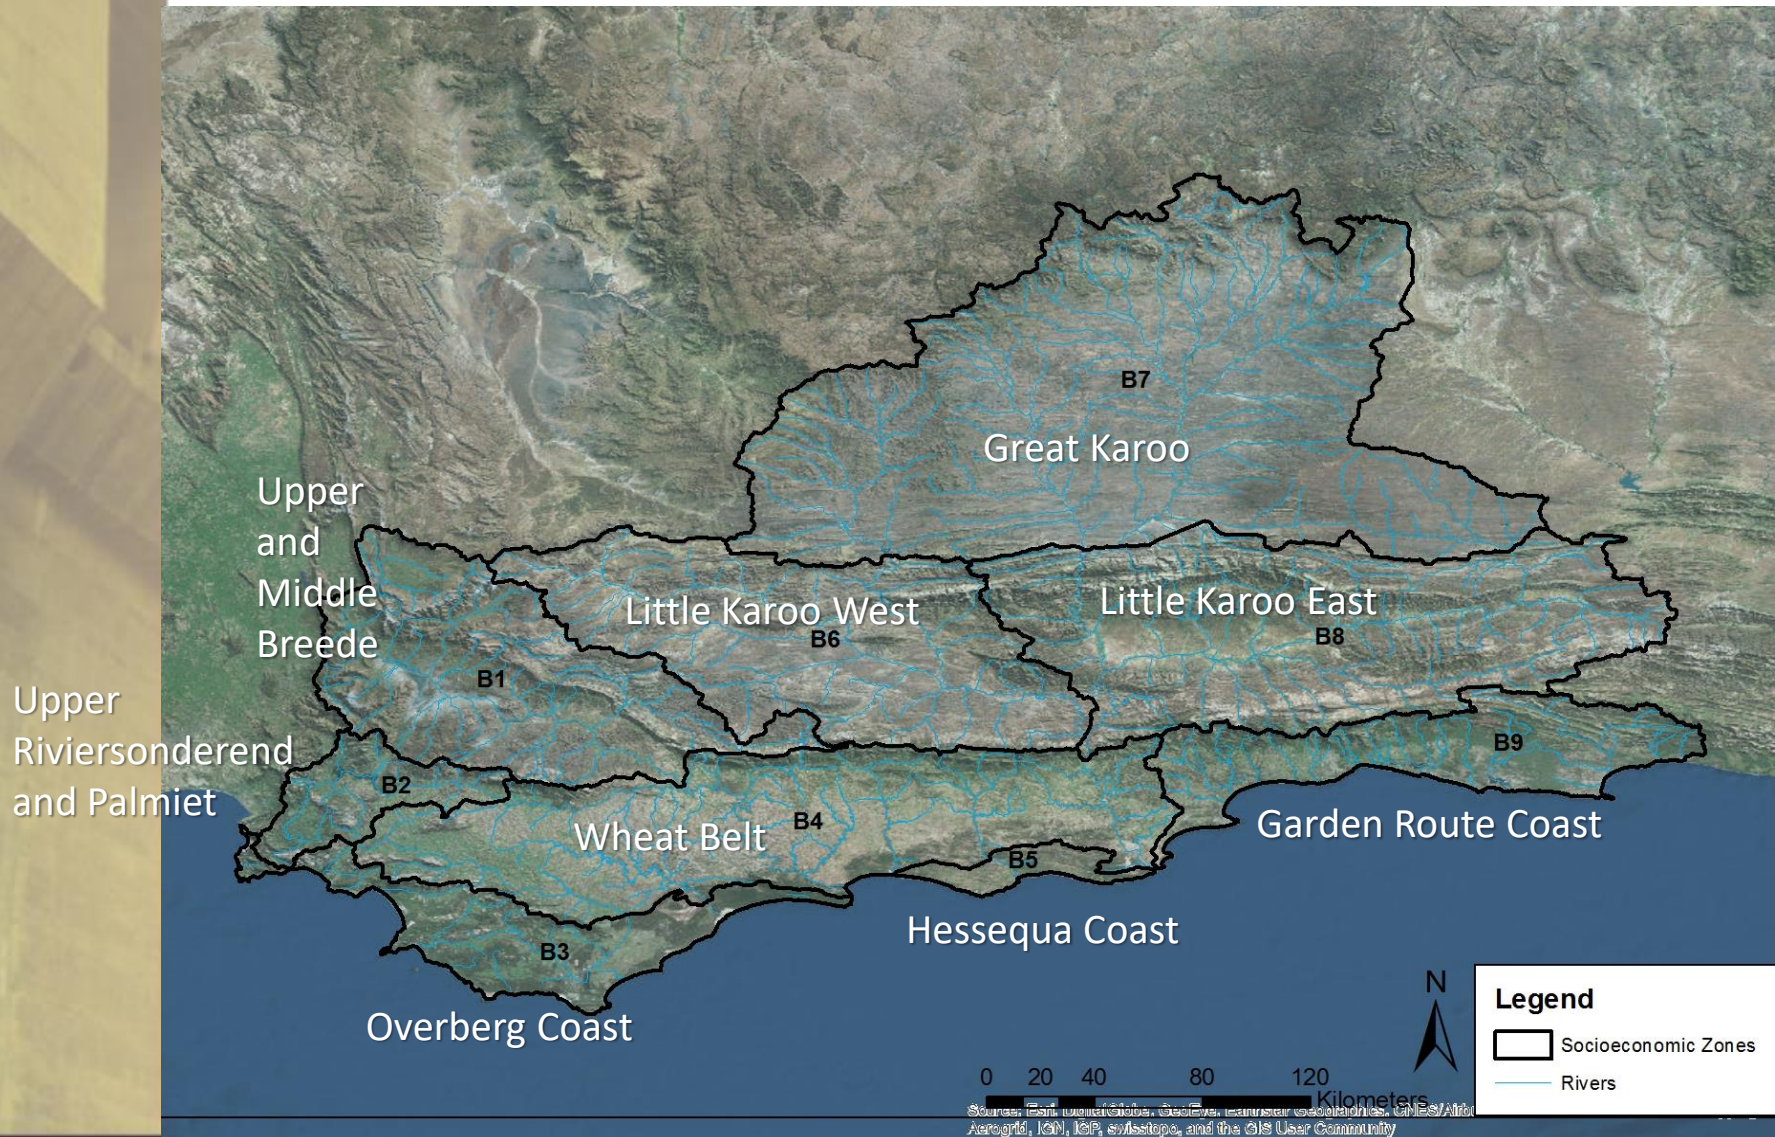

- In setting the Reserve for aquatic ecosystems,
 - Need to trade off the economic value of allocating water to ecosystems versus to other uses
 - Need to take non-monetary factors into account, including meeting biodiversity conservation targets

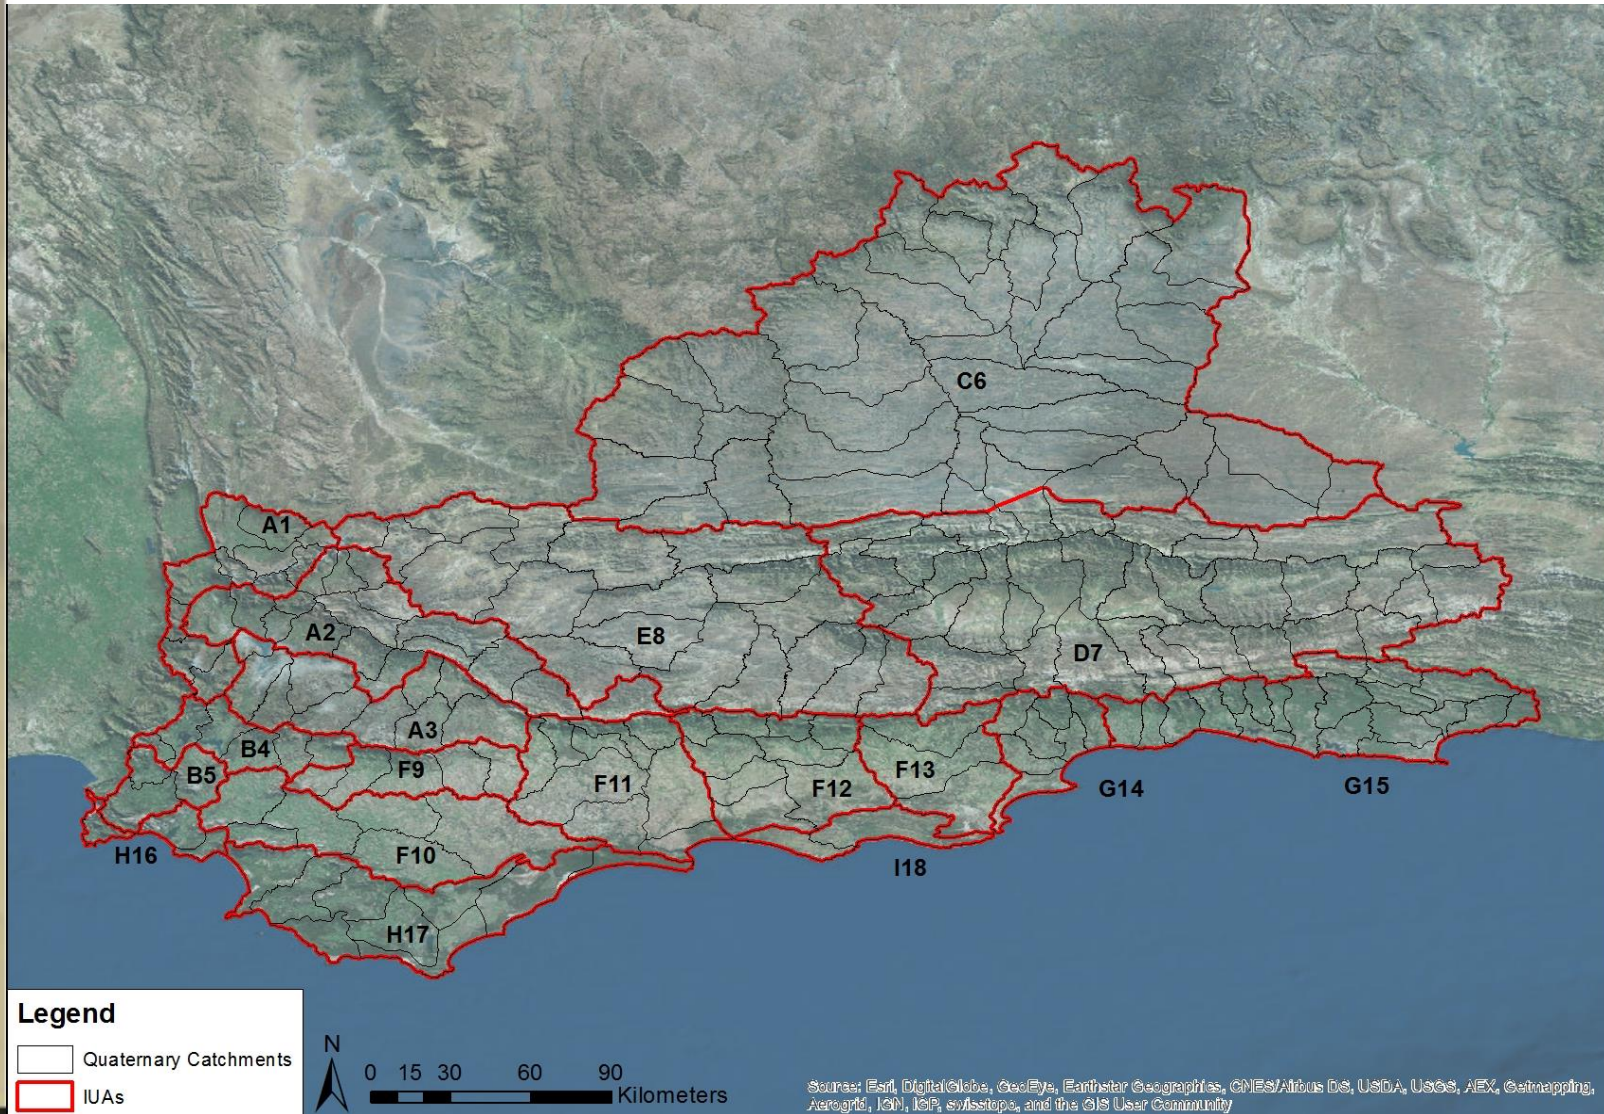

Socio-economics component

- Review economic value of activities in the study area, with emphasis on water-dependent activities
- Estimate the value of aquatic ecosystem services
- Estimate the relationship between ecosystem health and ecosystem value
- Undertake scenario analysis to estimate costs and benefits of different levels of environmental protection (classification scenarios)

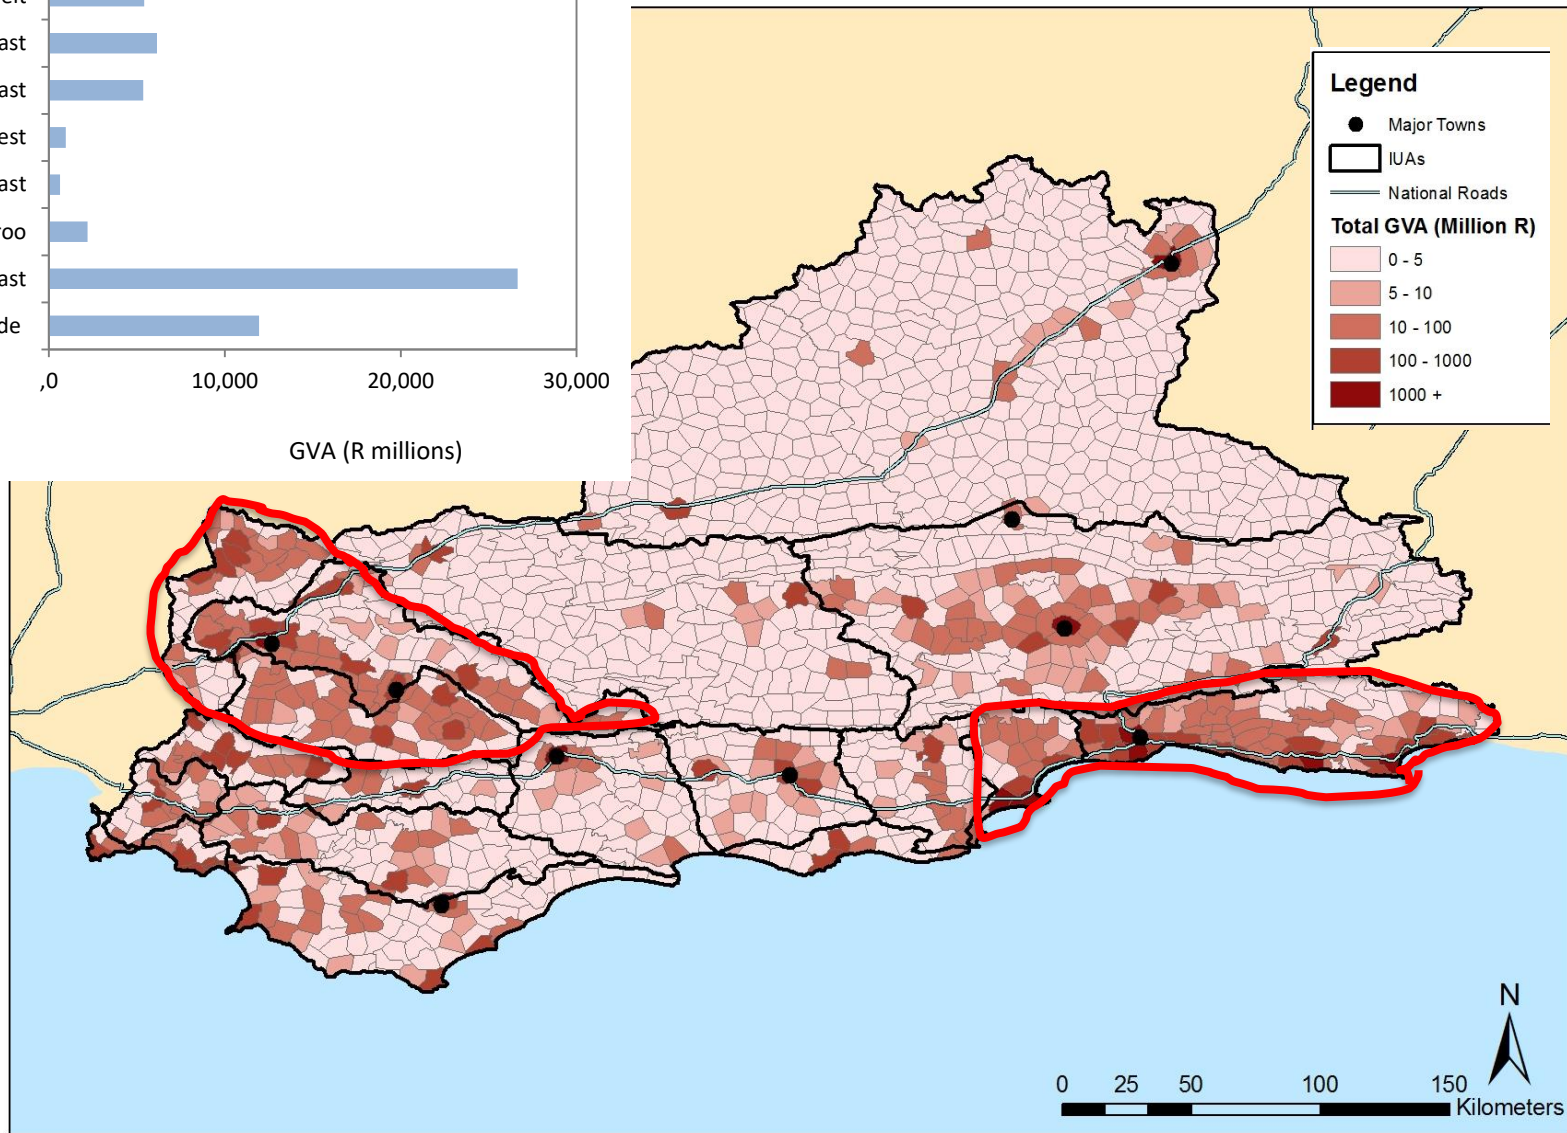

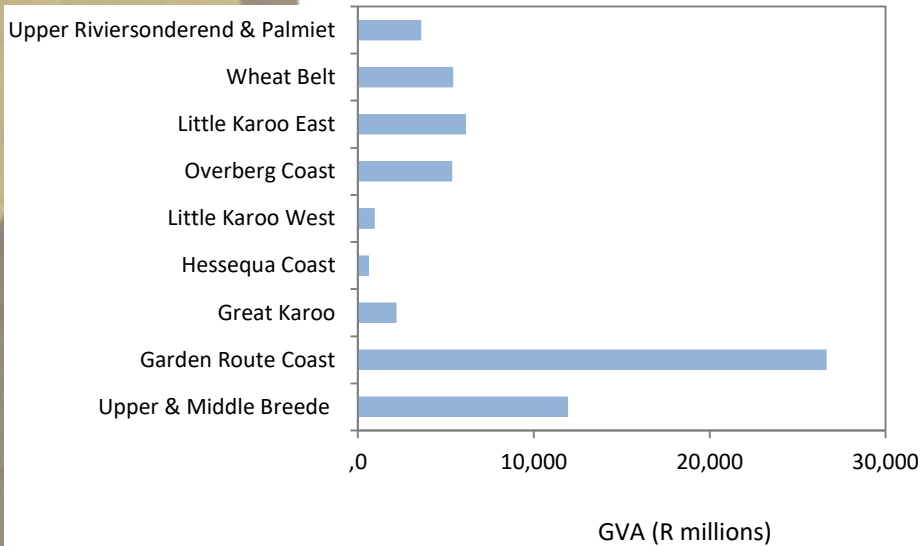

Socio-economic zones

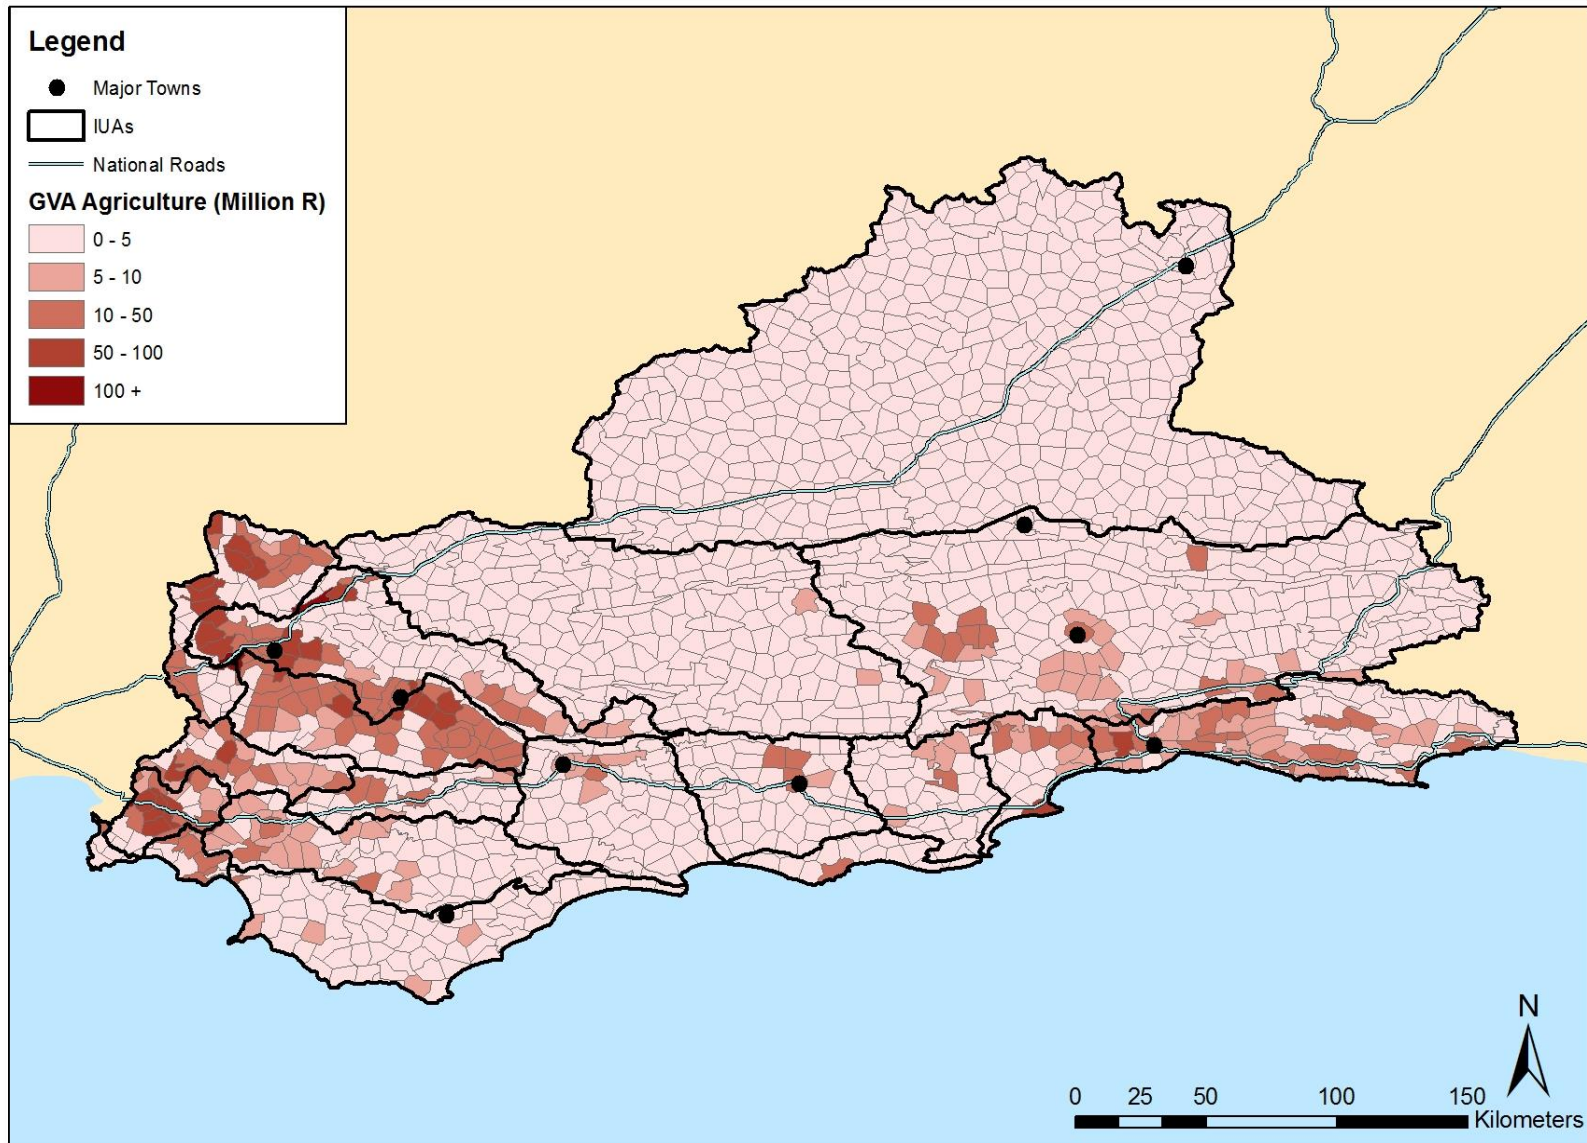

IUAs

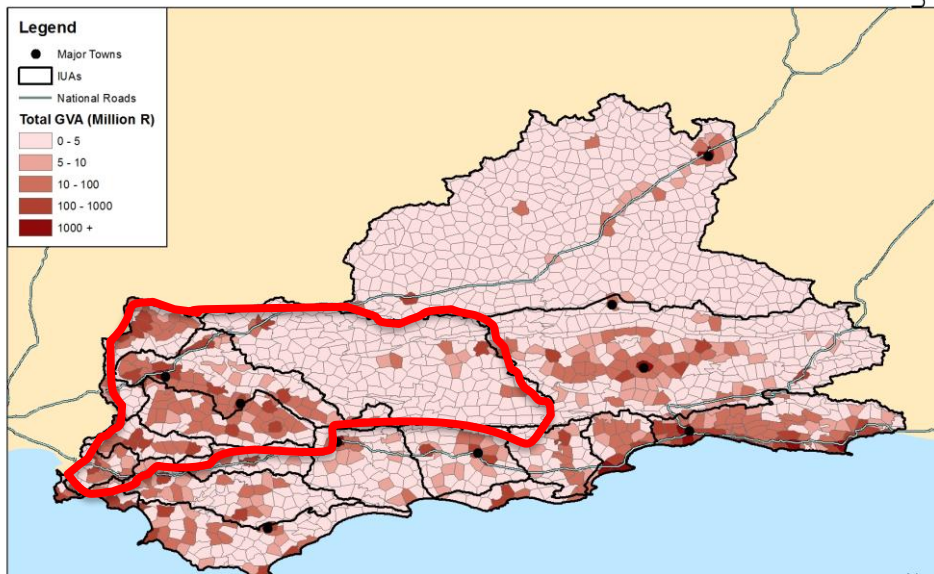

Contribution to GGP – all sectors

Agricultural contribution to GGP

Relative importance of agriculture

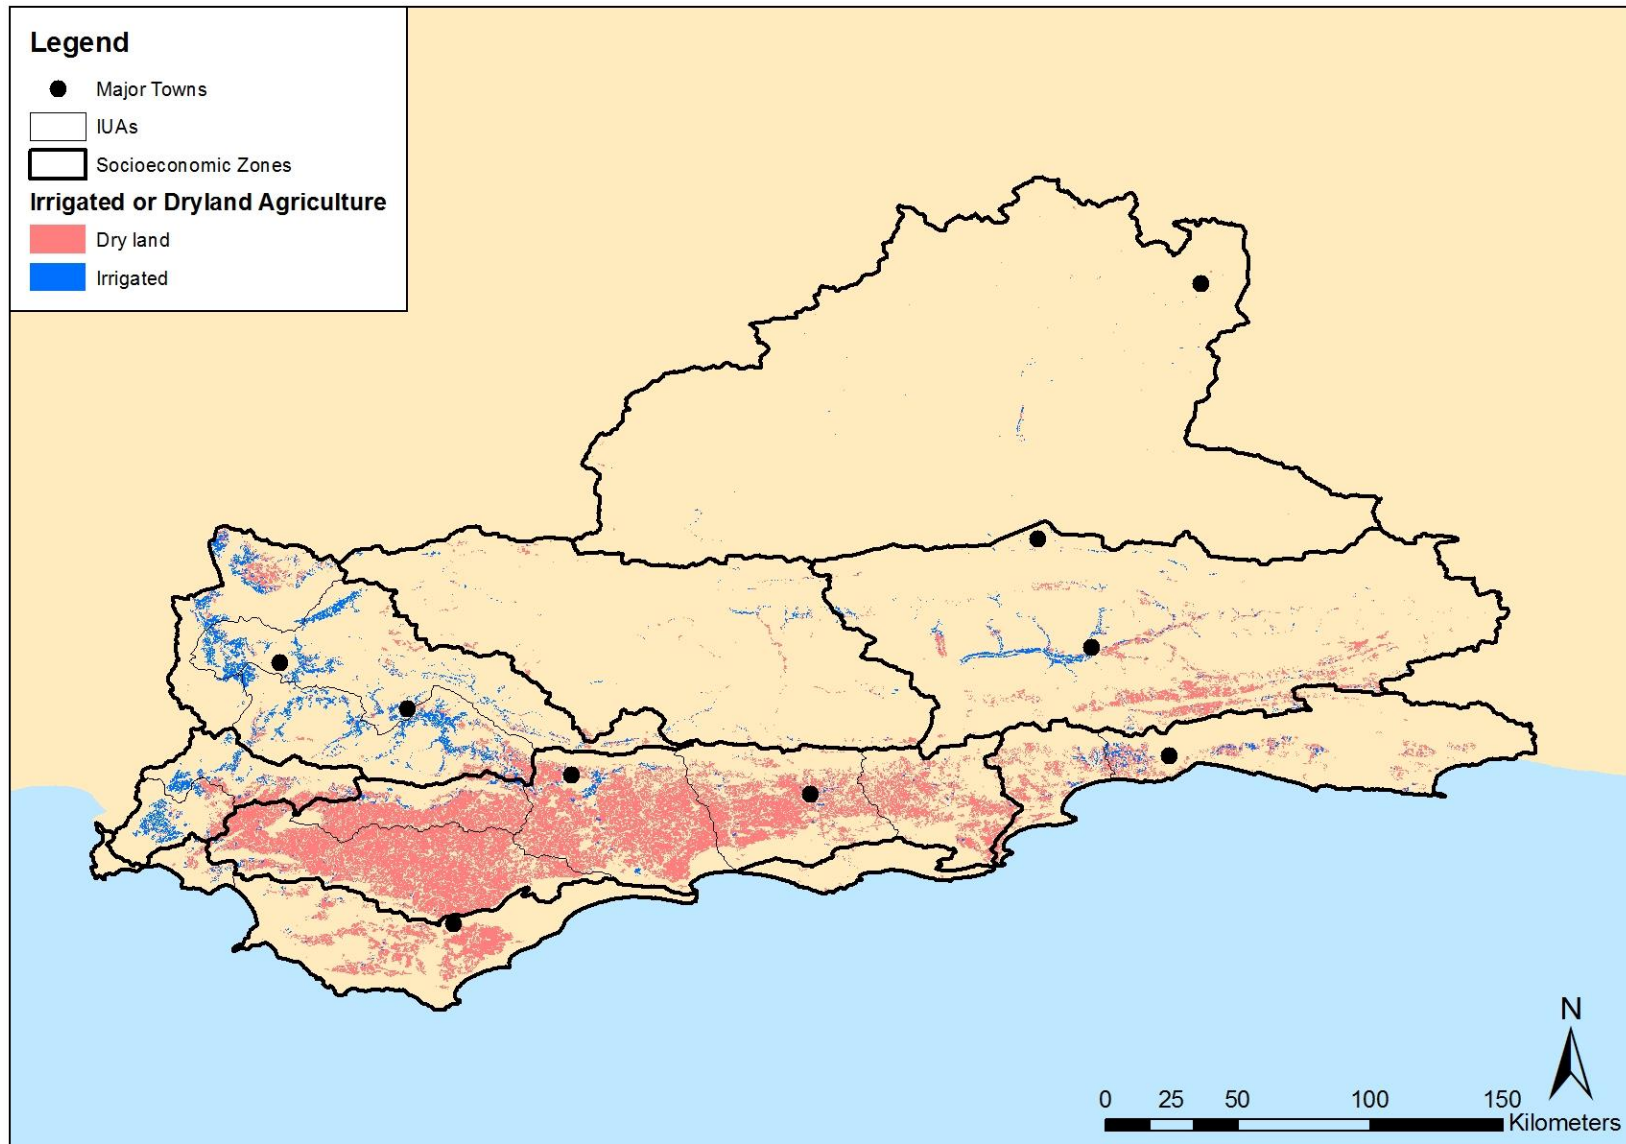

- Area where agric contributes ~20% of all sectoral GVA

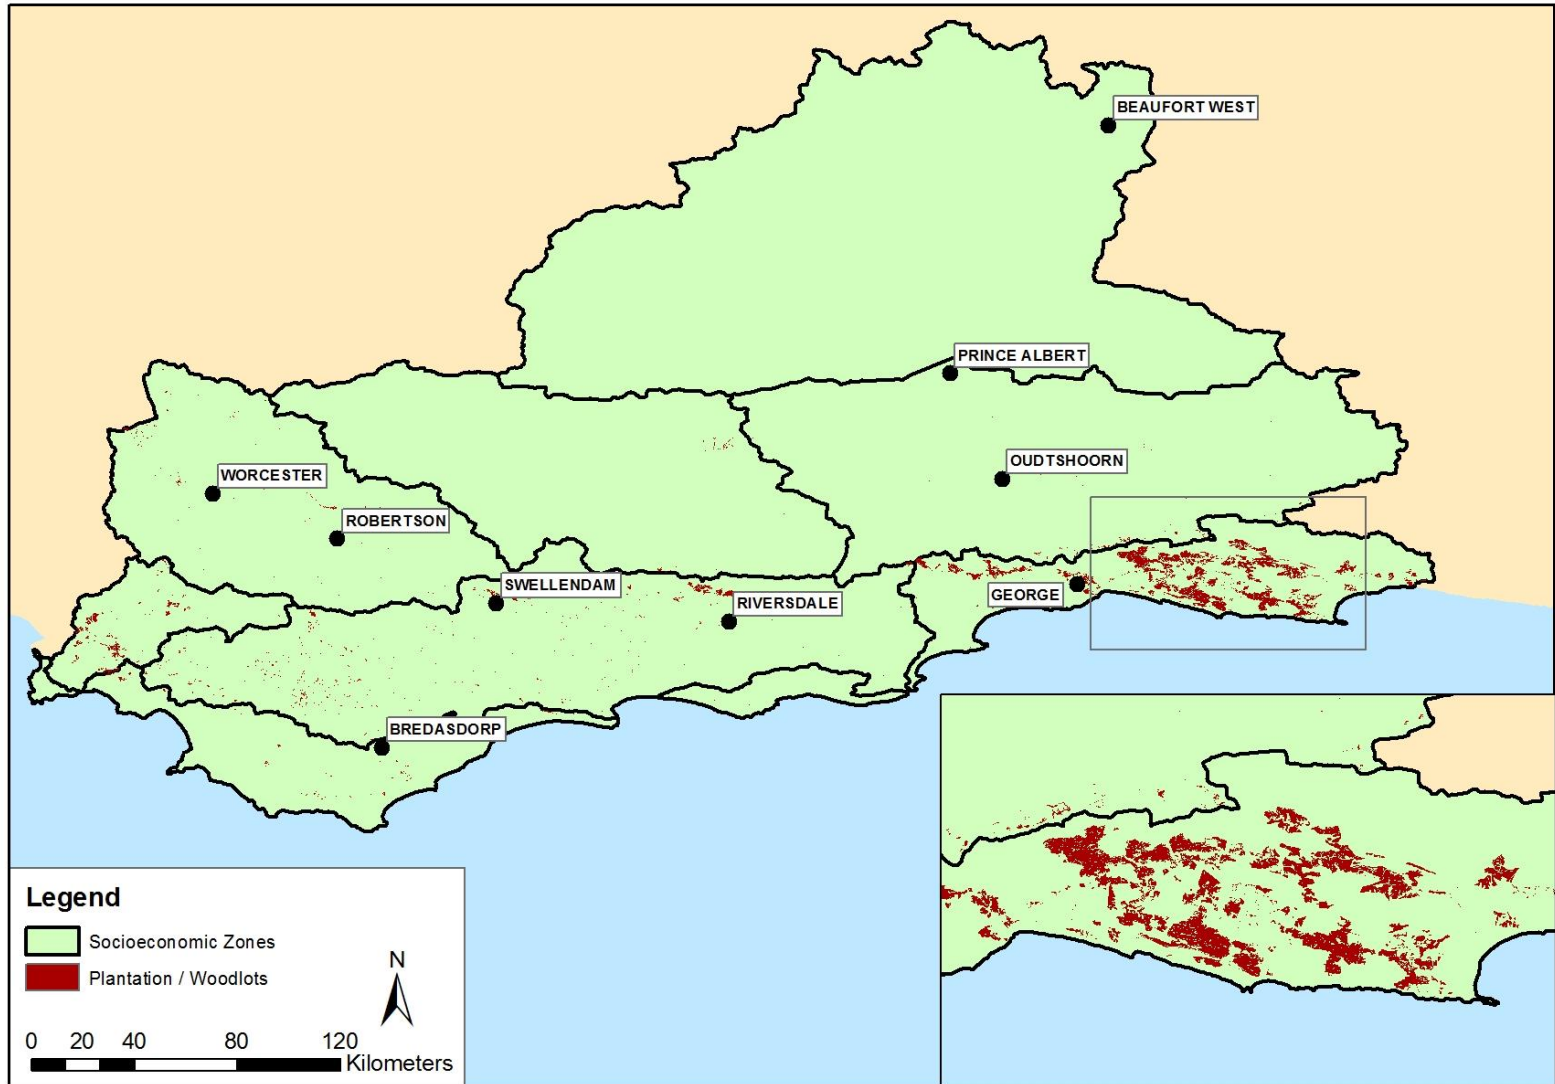

Current water use

Irrigation areas (blue)

Plantation forestry

Scenarios considered

- Extract as much water as possible* (ESBC)
- Maintain present condition (PES)
- Recommended ecological condition (REC)
- Spatially-targeted mix

Also (for comparative purposes only)

- what would happen without environmental constraints (No EC), and
- with climate change (No EC + CC)

Scenario assumptions

- Agricultural & forestry use is capped
 - No further increases in water allocation apart from existing plans
- High growth in urban & industrial water demand
 - i.e. worst case scenario (now less likely, but balances lack of CC)
 - Taken from Small Towns Study projections based on population and economic growth
- Planned surface water schemes are implemented
- **Demands are met**
 - If classification requires an increase in the environmental Reserve, resulting shortfalls in water supply will be remedied to ensure that projected demands will be met
 - This will happen by accelerating the implementation of planned infrastructure + additional measures as required

Scenario assumptions

- Costs of substituting surface water abstractions are based on recent estimates
 - May be overestimates (technological advances) or underestimates
 - Non-flow measures could reduce this requirement.
- Environmental impacts of the alternate options are minimized
 - (ie in the price), but we acknowledge that they would not be zero
- We have not considered who will bear the cost in the analysis (beyond our scope). Options include
 - Government subsidy.
 - User pays: this will drive technological innovation, efficiency gains and adaptive strategies.
 - Urban users pay: will reduce urban demand; demonstrated WTP for secure and “greener” water.

Scenario analysis

1. Determine flow requirements (ecologists)

Based on the ECs of the scenario,

2. Estimate resultant shortfall (if any), and how to rectify (hydrologists)

Only what is actually feasible (in physical terms), taking sustainable yields of groundwater into account

3. Estimate the additional water supply costs (engineers)

4. Estimate changes in value of ecosystem services

5. Change in water supply costs and ecosystem services analysed over 25 years (2017-40)

Water supply costs (WCWSS)

Cumulative cost of supply Rm (PV)

The faster that water demands grow, the sooner we move to the next (more expensive) option

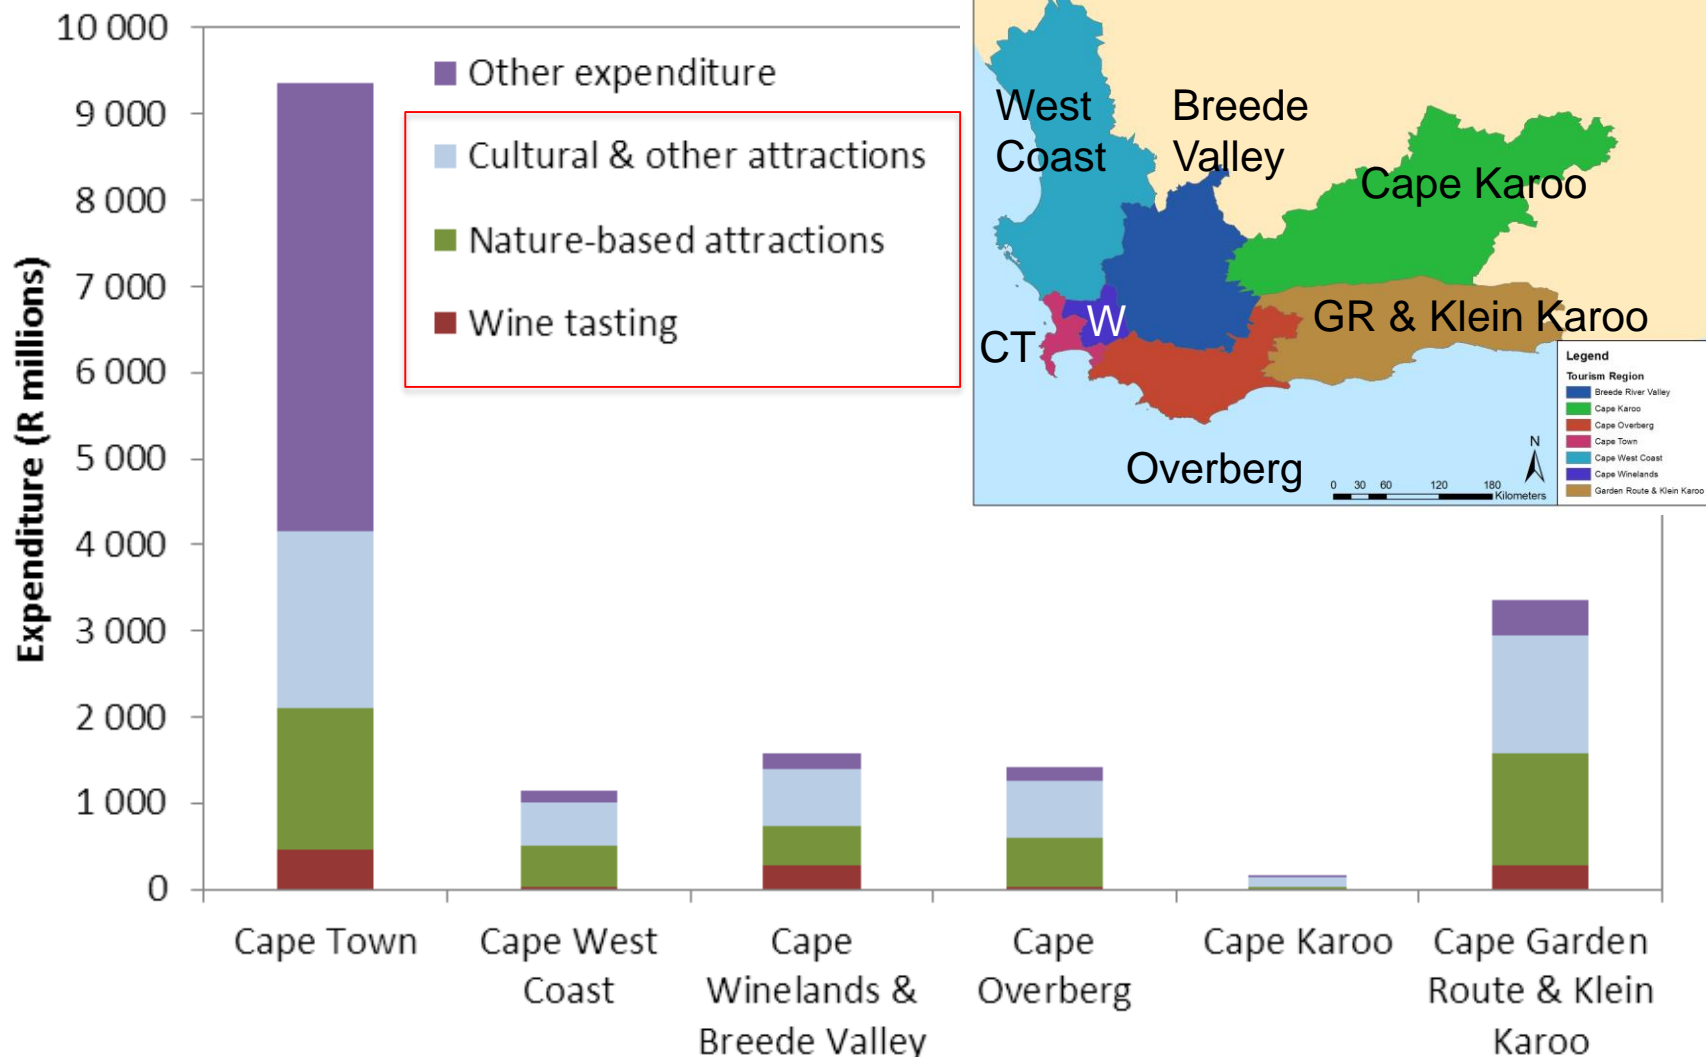

- Cost estimates explained in next segment

Ecosystem services considered

- Harvested natural resources
 - for subsistence
- Amenity values
 - Tourism
 - Property
- Nursery value of estuaries
 - Contribution to inshore fisheries

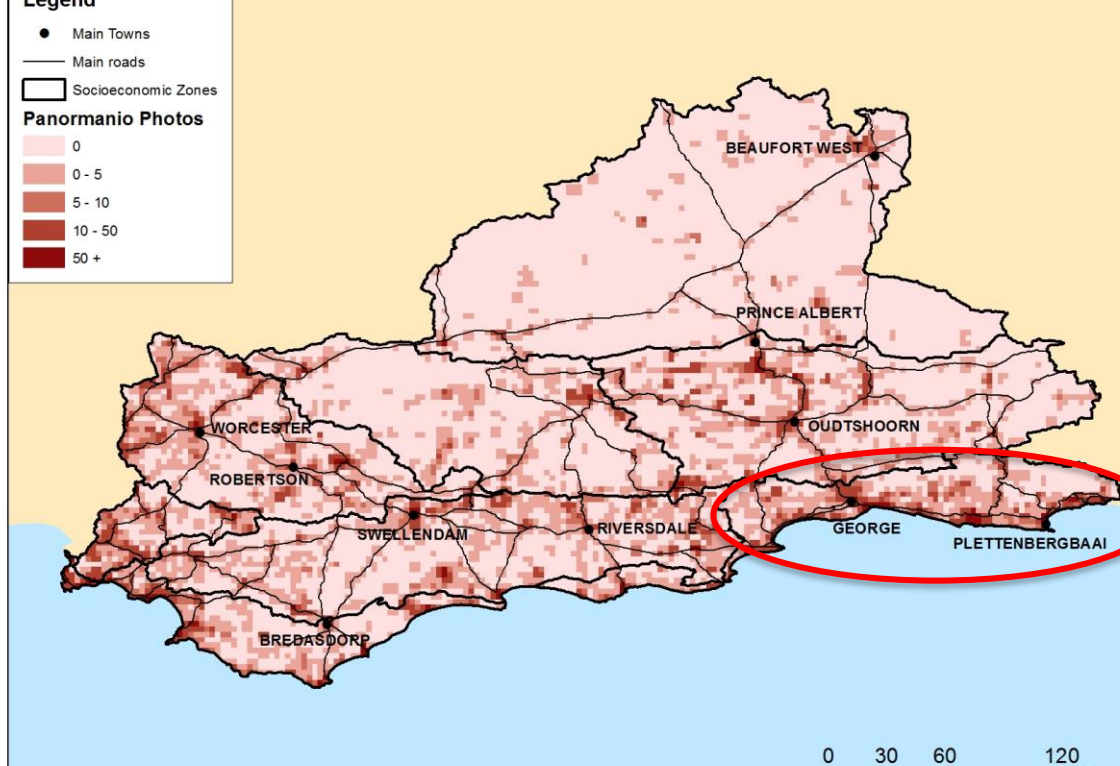

Tourism

Tourism value

- At least R2.4bn
- Estuary-based tourism: R800m – R3bn p.a.

Socio-economic zone	Gross Output (R million per year)	% at/near rivers and estuaries	Estimated contribution of rivers and estuaries (R million per year)
Upper and Middle Breede	679.4	55%	370.9
Upper Riviersonderend	336.1	47%	156.5
Great Karoo	143.5	67%	96.6
Little Karoo East	598.5	61%	363.2
Little Karoo West	270.9	48%	130.9
Wheat Belt	624.6	57%	355.2
Garden Route Coast	1 163.1	63%	734.2
Overberg Coast	841.7	23%	179.2
Hessequa Coast	97.5	39%	37.9
	4 755.3		2 442.4

Property value

- Annualised premiums associated with views/proximity
- Total R272m/y just for estuaries

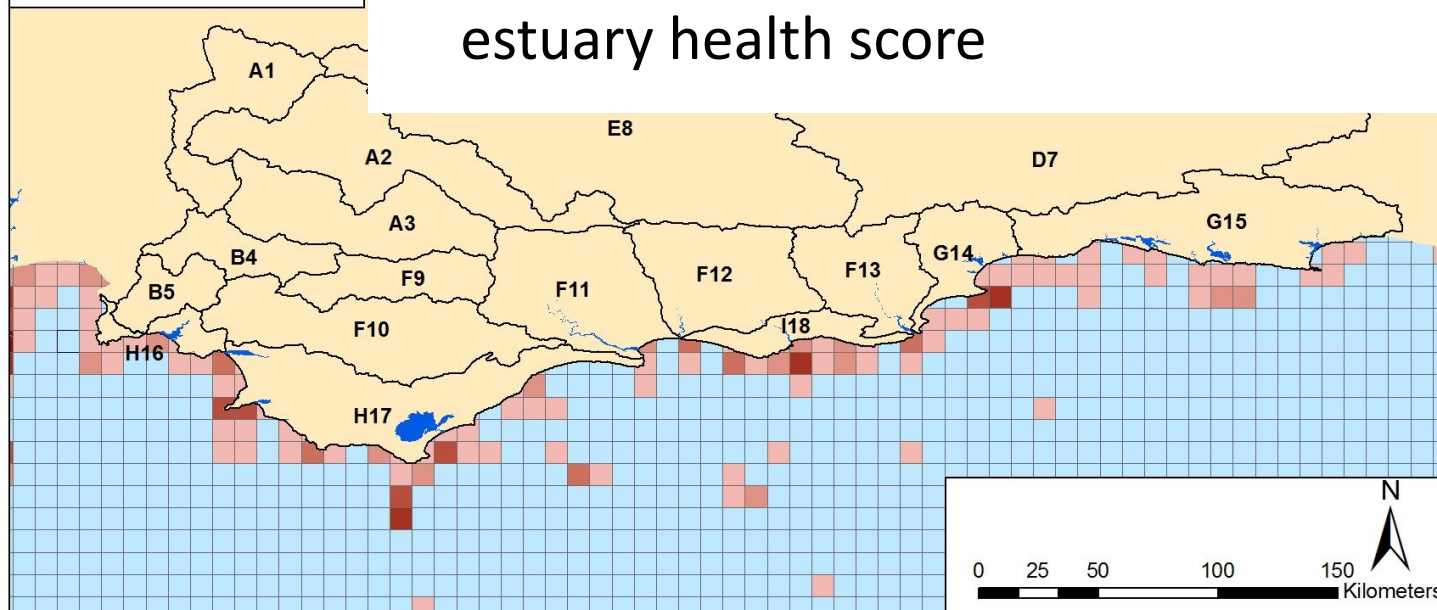

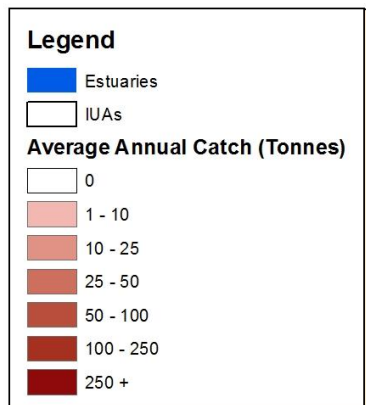

Zone	Estuary	Value R/y	Zone	Estuary	Value R/y
Overberg	Rooiels	2.2	Garden Route	Hartenbos	1.1
	Buffels (Oos)	2.7		Klein Brak	2.1
	Bot/Kleinmond	25.4		Groot Brak	20.0
	Onrus	2.6		Kaaimans	0.5
	Klein	1.5		Wilderness	10.2
	Uilskraals	2.0		Swartvlei	16.4
Wheat Belt	Breede	42.9		Knysna	67.6
Wheat Belt	Duiwenhoks	2.4		Noetsie	0.1
Hessequa	Goukou	26.7		Piesang	1.9
Wheat Belt	Gourits	18.2		Keurbooms	19.7
				Groot (Wes)	5.9

Relationship to ecosystem health

- Based on our estimates, logarithmic relationship between amenity value and estuary health
- From this, can estimate % change from PES to scenario EC

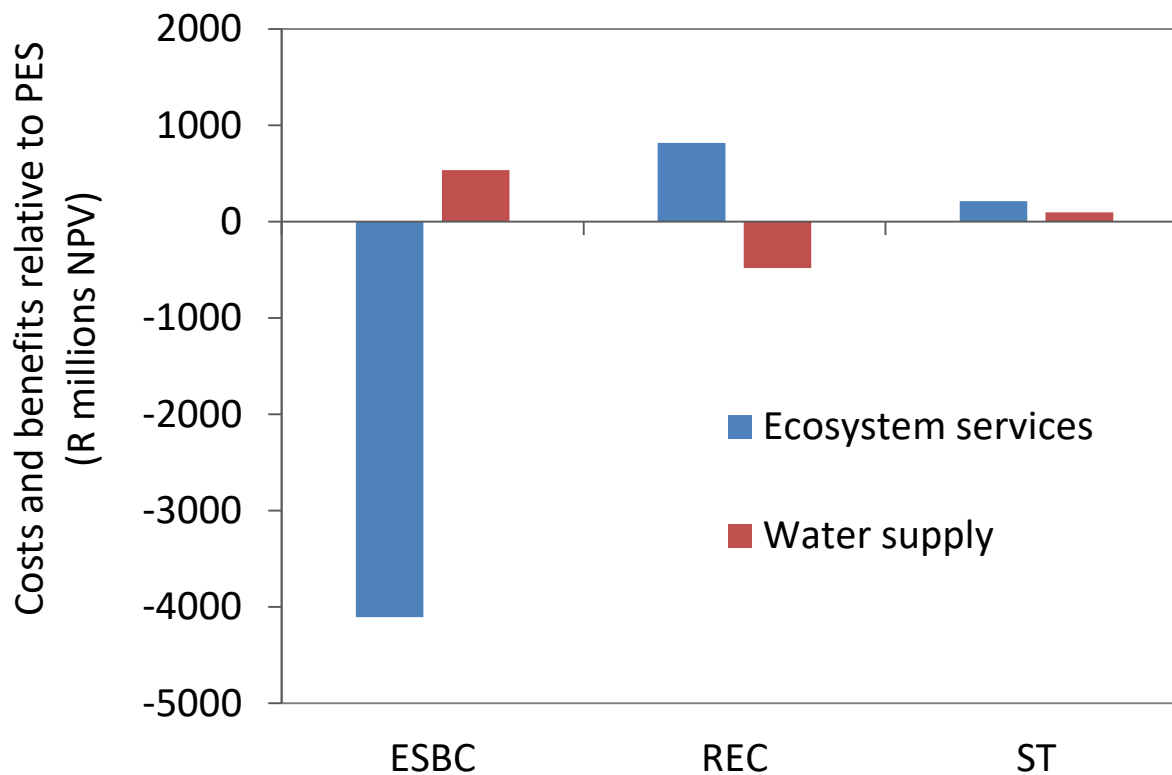

Nursery value

- nursery outputs from estuaries in WC at 27% of original capacity,
- lost services are worth R675 million
- Remaining service R1825
- Value is directly proportional to estuary health score

Scenario analysis

- Costs/benefits relative to PES scenario

- ESBC comes at v high cost to society
- REC has highest net benefit
- Spatially-targeted scenario avoids water losses
 - Net benefit similar to REC
- Maintaining PES = third best outcome

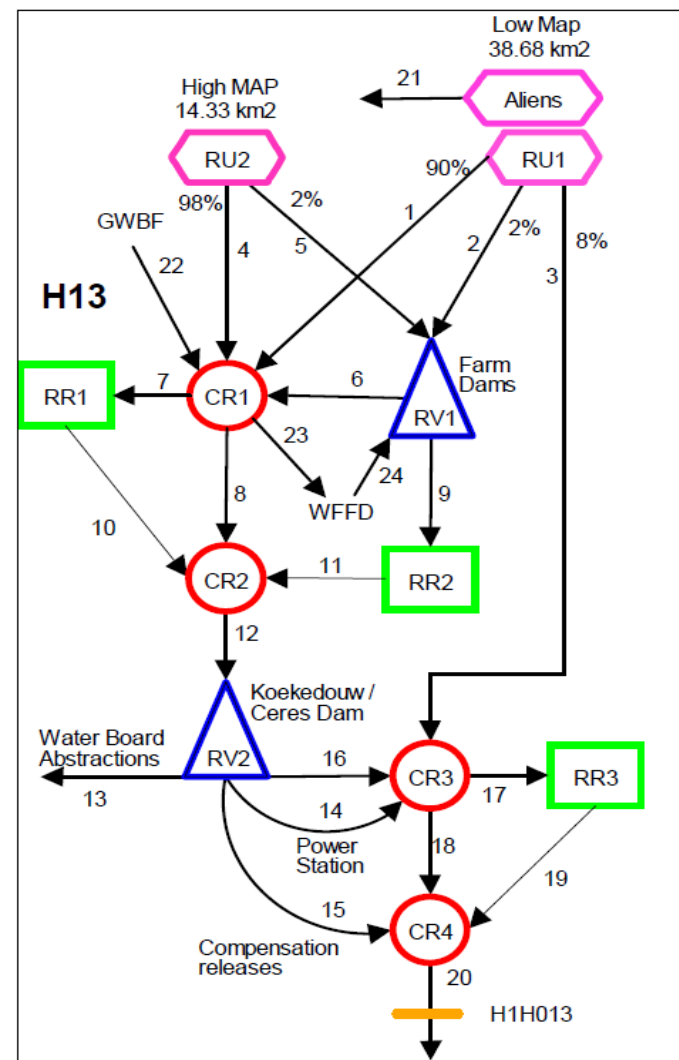

Hydrology, water demands & infrastructure costing

Surface water hydrology

- WRSM2012 Pitman Rainfall-Runoff Catchment Modelling System - previously configured for all rivers in the Breede-Gouritz WMA (WRC, 2016).
- Configurations covered both Natural and Current-day catchment conditions.
- Configurations were refined/corrected to bulk infrastructure, farm dams, irrigation/urban water requirements, return flows.
- These improved configurations were further sub-divided to reflect river and estuary nodes.
- Generated 90-year monthly flow sequences at all river and estuary nodes using monthly rainfall inputs for period 1920/21 – 2009/2010.
- Different sets of flow sequences used for different water requirement scenarios: Natural; Current-day; Projected for 2040 with New Bulk Infrastructure; Climate Change super-imposed on the latter.

Typical Pitman Rainfall-Runoff Catchment Model Configuration – Koekedouw River - Upper Breede

Urban water requirements

IUA	Location	Current (million m ³ /a)	High Growth (million m ³ /a)
G15	Knysna	4.0	8.8
G15	Bitou	3.8	8.1
G15	Greater George	12.3	27.8
G14	Mossel Bay	6.8	14.9
F12	Heidelberg	0.4	1.0
F11	Riversdale	1.6	3.7

A1	Ceres	4.2	8.8
A1	Prince Alfred Hamlet	0.4	1.0

Possible bulk surface water supply infrastructure augmentation schemes in place by 2040

IUA	Recipient	Details
G15	Bitou	Off-channel Wadrif Balancing Dam receiving 3.0 million m ³ /a through increased pumping from the Keurbooms River. New groundwater scheme supplying 1.8 million m ³ /a.
G15	Knysna	Augmented Charlesford pump station on the Knysna River delivering 3.3 million m ³ /a to the planned Concordia Balancing Dam.
G15	George	Raised Garden Route Dam - additional 2.5 million m ³ /a supply. New Malgas River Dam – additional 7.0 million m ³ /a supply. Re-use of treated effluent Phase 2 – additional 2.3 million m ³ /a.
D7	Oudtshoorn	New Kombuis Dam with FSC of 15 million m ³ on the Grobbelaars River.
C6	Gamka Irrigation Board	Raised Gamkapoort Dam FSC from 37 to 98 million m ³ .
H17	Hermanus	Raised De Bos Dam or new dam to provide 1.7 million m ³ additional capacity.
H16	Rooi Els, Pringle Bay, Betty's Bay	Raised Buffels River Dam or new dam to provide 2.8 million m ³ additional capacity.
A1	Voëlvlei Dam inter-basin transfer	Maximum capacity of the planned Michell's Pass diversion on the Breede River to Voëlvlei Dam in the Berg River catchment set at 36 million m ³ /a.
A2	Breede River irrigators	Increased allocations from Brandvlei Dam through increased capacity for the Smalblaar-Holsloot diversions as well as for the Papenkuils pump station, totalling 51 million m ³ /a.

**REC scenario for 2040 conditions:
Reconciliation of deficits per IUA**
Examples

IUA	Total Nodal Deficits under REC million m³/a)	From Groundwater	From Surface Water Scheme	From TMG Aquifer
H16: Overberg West Coastal	12.0	5.5	-	6.5
A1: Upper Breede Tributaries	38.7	30.0	3.1	5.6
F11: Lower Breede Renosterveld	8.3	2.1	6.2	-
D7: Gouritz-Olifants	41.5	11.5	-	30.0
G15: Coastal (Gouritz)	42.4	34.2	8.2	-

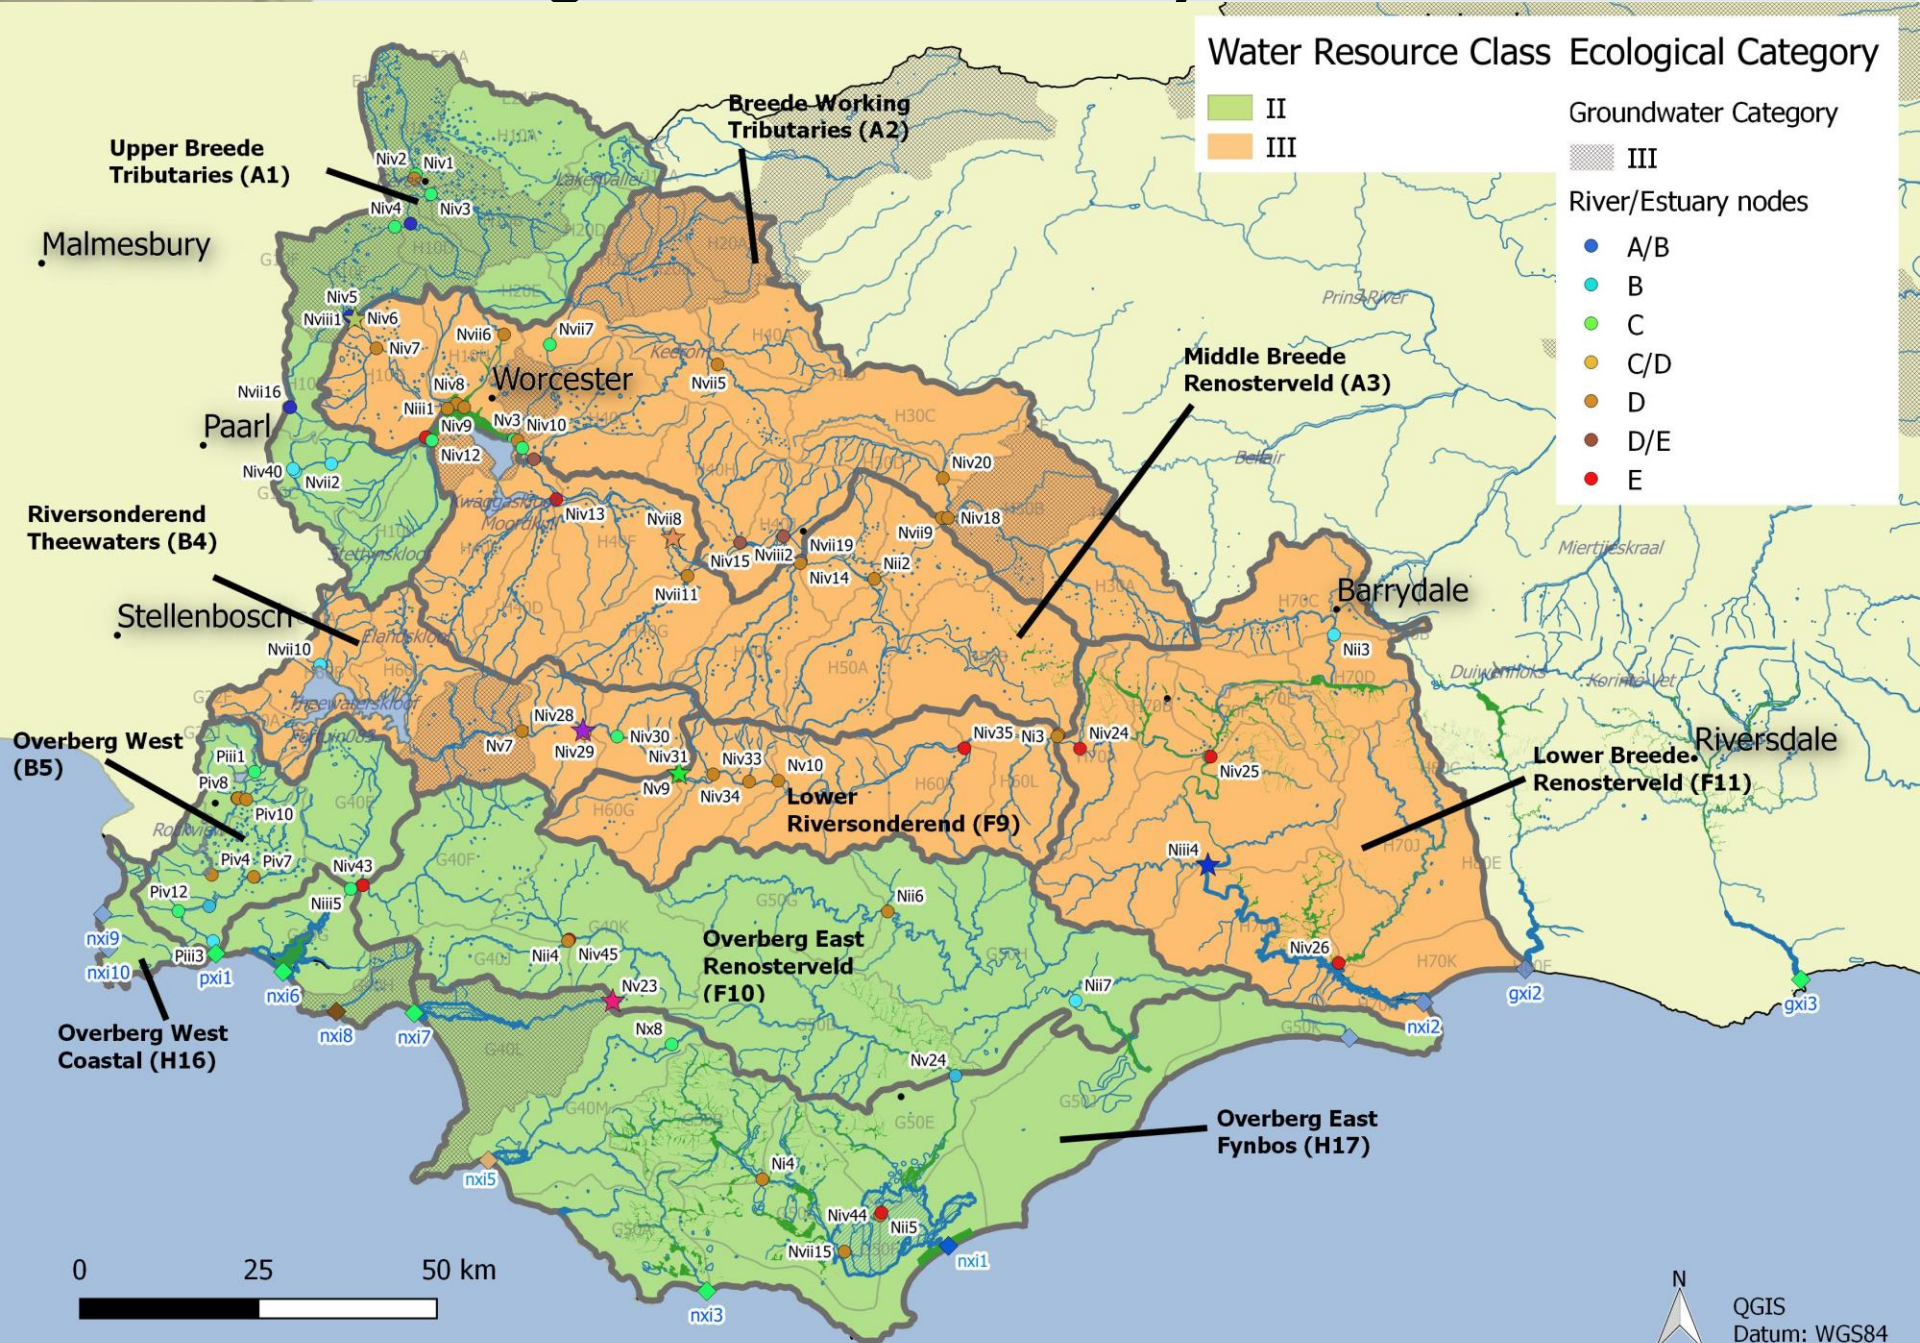

**Assumed Unit Costs of Water Supply from
Various Types of Water Sources
(Capital and Engineering Only)**

Type of Water Supply Scheme	Unit Cost (R/m ³)
Surface Water Storage Scheme	13.0
Large Surface Water Pumping Scheme	8.0
Large Groundwater Pumping Scheme	7.0
Raising of Earth Dam	7.0
Small Groundwater Scheme	5.0
Table Mountain Group Aquifer Scheme	12.50

Proposed Scenario

Methodology for Determination of RQOs

STEP 1: DELINEATE CATCHMENT

Outcome: Integrated Units of Analysis and Resource units as defined in the WRCS approach.

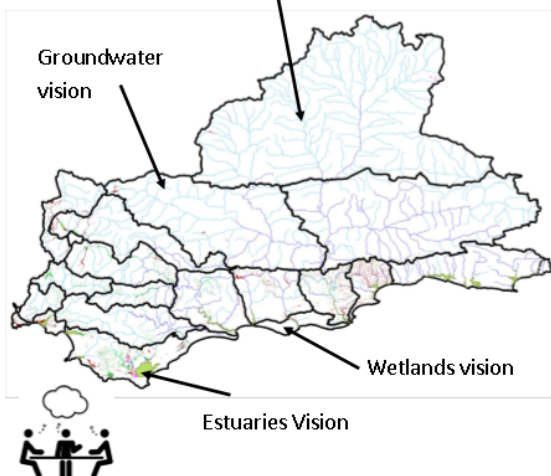

Complete

STEP 2: ESTABLISH VISION FOR CATCHMENT

Outcome: Align the diverse and competing interests in the resource into a collective desired future state. This involves multiple stakeholders in the strategic planning process.

Rivers vision

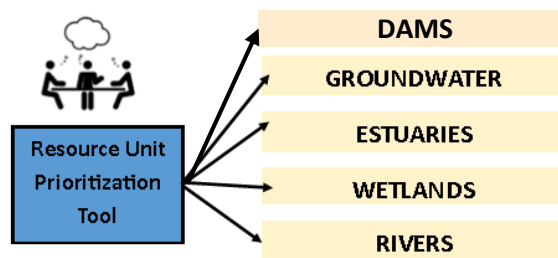

Groundwater vision

Complete

STEP 3: PRIORITISE & SELECT PRELIMINARY RESOURCE UNITS FOR RQO

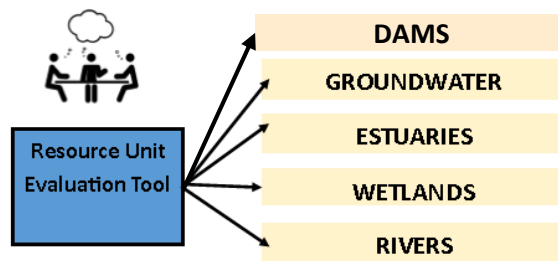

Outcome: Use the resource unit prioritization tool to select priority resource units.

Final

STEP 4: PRIORITISE SUB-COMPONENTS FOR RQO & SELECT INDICATORS FOR MONITORING

Outcome: Identify & prioritize sub-components that may be important to users or environment. Select sub-components and associated indicators for RQOs and Numerical Limits.

Draft

Study Status: RQOs

STEP 5: DEVELOP DRAFT RQOs & NUMERICAL LIMITS

Outcome: RQOs are essentially narrative but sometimes broadly quantitative descriptions of the resource. These are gazette, whilst Numerical Limits are not. These should be set for discussion with stakeholders.

Draft

STEP 6: AGREE RESOURCE UNITS, RQOs AND NUMERICAL LIMITS WITH STAKEHOLDERS

Outcome: Stakeholders who were involved in the setting of the vision are involved in reviewing how their input has been considered and taken forward. Decide on Resource Units, RQOs and Numerical Limits.

STEP 7: GAZETTE RESOURCE QUALITY OBJECTIVES

Outcome: A Water Resource Class configuration and associated RQOs for the entire catchment is published by the Minister in the Government Gazette as required in the National Water Act of 1998.

Classification:

- Proposed Scenario
(RUs with Targeted ECs (TECs) for water resources,
per IUA class)

RQOs:

- Resource Unit prioritisation (using RUPT Tool, where applicable)
- Resource Unit evaluation (using RUET Tool, where applicable)
- Define RQO and Numerical Limits
- Define Monitoring Program

Evaluation of RUs - method

- Customised DWS **RU Evaluation Tool** used to identify selected indicators *for prioritised RUs* for which RQOs (descriptive and numerical) have be written, by identifying:

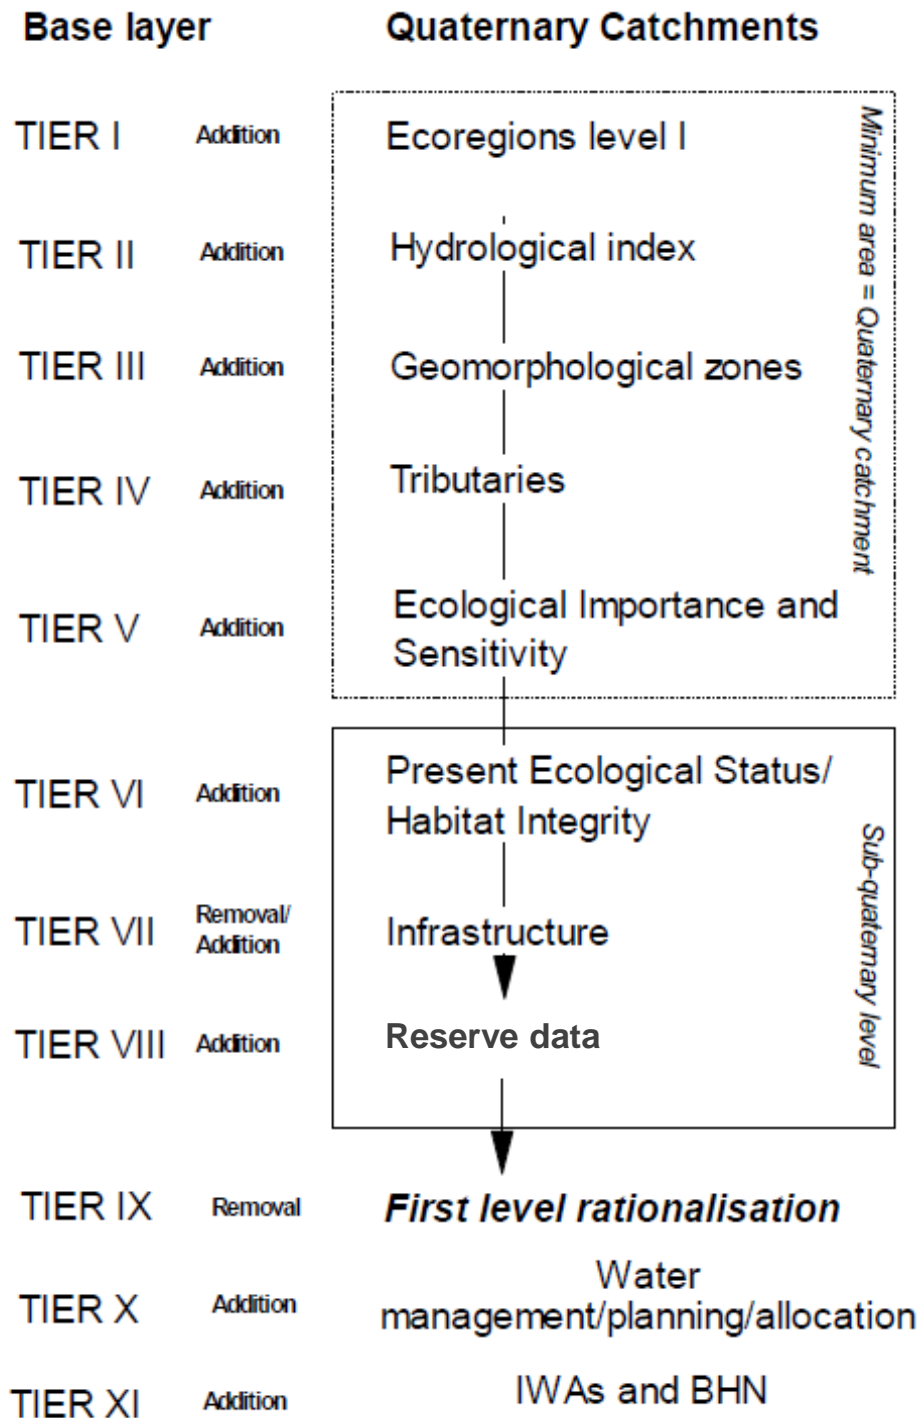

- **Prioritised Resource Unit per IUA**
 - i.e. grouped areas e.g. river basins, deemed similar in terms of various characteristics
- **Component/ Sub-component**
 - E.g. Quantity/ Flow
- **Indicator**
 - Representation of trend tracking the measurable change in a system over time. Focuses on a small manageable set of information
- **Resource Quality Objective (RQO)**
 - Descriptive broad statements describing overall objectives for the Resource Unit
- **Numerical limit**
 - Quantitative descriptors of different components of the Resource Unit

Rivers

- Selecting rivers in the Breede Gouritz WMA
- Modelling flow-condition relationships
- Outcome of flow scenarios on river condition
- RQOs for rivers (indicators to monitor)
- Monitoring programme for rivers

Selecting rivers

Methodology (DWAF, 2007):

- Eleven “tiers” of rules used to establish river nodes.

Nodes:

- 66 river nodes - Gouritz WMA
- 76 river nodes - Breede WMA

Modelling links between flow and ecological condition

1. Define the scenarios
2. Describe surface flows and ecological conditions (EC)
3. Quantify changes in flow and ecological conditions
 - a) The balancing tool contains:
 - i. Baseline ecological conditions for rivers and estuaries.
 - ii. Modelled current day and natural flows.
 - iii. Modelled Reserve flows for a range of ecological conditions, based on various Reserve studies.
 - b) Allows the user to toggle flow and see changes in condition.
 - c) Reports surpluses or deficits in flow relative to current day.

Outcome of scenarios on ecological condition of rivers

Indicators for monitoring RQOs

QUANTITY: flow

low flows and high flows, monthly average volume (MCM)

QUALITY:

nutrients, salinity, system variables, toxins and pathogens

HABITAT: condition/geomorphology/vegetation

IHI, PAI, GAI, VEGRAI, MIRAI, FRAI

sediment particle size (D_{50})

% cover of indigenous and alien cover in 3 zones

BIOTA: macroinvertebrates/fish

SASS and ASPT scores, # of families present, key indicator families

CPUE of fish species present, FROC

Monitoring programme

Hydrology:

- Continuous discharge data from gauging weirs (Activity H1)
- Visual inspection of flow during the dry season (Activity H2)

Geomorphology:

- GAI score (Activity G1)
- Sediment size (Activity G2)
- Width and depth (Activity G3)
- Habitat diversity (Activity G4)

Riparian vegetation:

- VEGRAI score (Activity R1)
- Cover of indigenous and exotic species in three lateral zones (Activity R2)

Macroinvertebrates:

- MIRAI score (Activity M1)
- SASS5 and ASPT scores (Activity M2)
- Diversity of macroinvertebrates (Activity M3)

Fish:

- FRAI score (Activity F1)
- FROC or CPUE of fish species (Activity F2)

QUANTITY: Flow – excludes inter-annual floods

MOTIVATION FOR ACHIEVING REC/TEC

The Hartenbos estuary is considered to be of “average importance” from a biodiversity conservation perspective (ranked 75 out of 273 estuaries in South Africa) and has not been included on the list of existing or desired protected areas (Turpie et al. 2012). The system is nonetheless important from a socio-economic perspective – it is an important node for recreation, tourism and contributes significantly to property value. It is also important to maintain the system in a state of health that is safe for contact recreation. The REC for the estuary is thus a C, one category higher than present. However, it has been determined that water abstraction from this system cannot be reduced in future without compromising requirements for other users in this region. The MAR for the Target Ecological Condition thus remains as for present (65.0%). The most important threats to the Hartenbos estuary include freshwater deprivation (due to abstractions from the Hartbeeskuil Dam, for agricultural and domestic use), sedimentation (due to reduced flow and concomitant changes in mouth dynamics) and impaired water quality (due to agricultural return flows and poor quality of stormwater from informal settlements). Given that it is not possible to restore flows required to achieve the REC, concerted effort on the part of DWS and other stakeholders (local, provincial and other national government agencies) is thus required to address other threats to the estuary in accordance with the Ecological Specifications included below, thereby facilitating its restoration to the REC.

Component	SPECIFICATIONS
Flow	<ul style="list-style-type: none"> %nMAR: 65.0, dry season flow >0.05 Mm³/month
Mouth condition	<ul style="list-style-type: none"> % time mouth closed should not increase/decrease by >10% from present; no period of closure >3 months
Water quality	<ul style="list-style-type: none"> DIN not to exceed 200 µg/ℓ (average); DIP not to exceed 50 µg/ℓ (average)
Microalgae	<ul style="list-style-type: none"> Phytoplankton not to exceed 8 µg/ℓ (median), and/or 20 µg/ℓ (once-off) and/or cell density not to exceed 10 000 cells/ml (once-off) Benthic microalgae not to exceed 42 mg/m² (median)
Macrophytes (plants)	<ul style="list-style-type: none"> Maintain distribution of macrophyte habitats within 20% of present (Supratidal salt marsh: 29%, Reeds & sedges: 10%, sand/mud banks: 10%)
Invertebrates	<ul style="list-style-type: none"> Populations of key invertebrate species should not deviate from average baselines (as determined in first three visits) by more 30%
Fish	<ul style="list-style-type: none"> Relative contribution for key groups of fish (estuarine resident, marine migrant, freshwater, etc.) should not deviate from average baselines (as determined in first three visits) by more 30%
Birds	<ul style="list-style-type: none"> Number of birds in any group, other than species that are increasing regionally such as Egyptian geese, should not deviate by more than 30% from baseline median (determined by past data and/or initial surveys)

			EC	%nMAR	PES	%nMAR	EC	%nMAR
G14-Groot Brak	Gxi22	K10B	C	80.7	D	65.0	C	65.0

Additional (non-flow related) interventions to achieve the REC:

- Dam construction has resulted in a reduction in base flow and floods to the system, with a shift in the onset of the high flow period and an increase in the duration of the low flow period;
- Artificial breaching;
- Loss of tidal flows and habitat as result of bridge construction (e.g. old N2, railway bridge);
- Infilling of estuary channel and mouth area as a result of loss of floods and artificial breaching;
- A significant reduction in water quality as a result of the Mossel Bay WWTW discharge and urban runoff;
- Development in the EFZ;
- Alien vegetation;
- Limited bait collection and fishing effort; and
- Human disturbance (which influences bird abundance).

Estuary monitoring programme

1. Additional baseline surveys to improve confidence of EWR study on the Klein Brak Estuary (priority components are highlighted).

Action	Temporal Scale (frequency and timing)	Spatial Scale (Number of stations)
Sediment dynamics		
Monitoring berm height using appropriate technologies.	Quarterly.	Mouth.
Bathymetric surveys: Series of cross section profiles and a longitudinal profile collected at fixed 500 m intervals, but in more detail in the mouth including the berm (every 100 m). Vertical accuracy at least 5 cm.	Once-off.	Entire estuary.
Collect sediment grab samples (at cross section profiles) for analysis of particle size distribution and organic content (and ideally origin, i.e. microscopic observations).	Once-off.	Entire estuary.
Water quality		
Collect samples for pesticides/herbicide and metal determinations in river inflow.	Once-off.	Near head of estuary in Moordkuils (K1H5) and Brandwag (K1H4) tributaries.
Collect surface and bottom water samples for inorganic nutrients (and organic nutrient) and suspended solid analysis, together the in situ salinity, temperature, pH, DO and turbidity profiles.	Quarterly, preferably for 2 years	Entire estuary (10 - 13 stations).
Measure pesticides/herbicides and metal accumulation in sediments (for metals investigate establishment of distribution models – refer to Newman and Watling, 2007).	Once-off.	Entire estuary, including depositional areas (i.e. muddy areas).
Microalgae		
Record relative abundance of dominant phytoplankton groups, i.e. flagellates, dinoflagellates, diatoms, chlorophytes and blue-green algae. Chlorophyll-a measurements taken at the surface, 0.5 m and 1 m depths, under typically high and low flow conditions using a recognised technique, e.g. spectrophotometer, HPLC or fluoroprobe. Intertidal and subtidal benthic chlorophyll-a measurements (four replicates each) using a recognised technique, e.g. sediment corer or fluoroprobe.	Quarterly, preferably over two years	Along length of estuary minimum five stations (include stations in upper reaches of Brandwag and Moordkuil arms).

Dams

- Resource Unit prioritisation
- Resource Unit evaluation
- Define RQO and Numerical Limits
- Worked example

- 2 levels of ranking of dams resource units
- First level of screening:
 - 27 significant dams selected in WMA

- Then the newly-configured **RU Prioritisation Tool (RUPT)** was applied. Steps were followed that ranks RUs against one another based on:
 - position, socio-economic and international importance
 - role in regulating services and ecological importance
 - water quality threats
 - practical considerations

8 Prioritised dams

Breede-Overberg area

- Theewaterskloof

 - Yes
- Rivers
- Major Roads
- ▭ Water Management Area

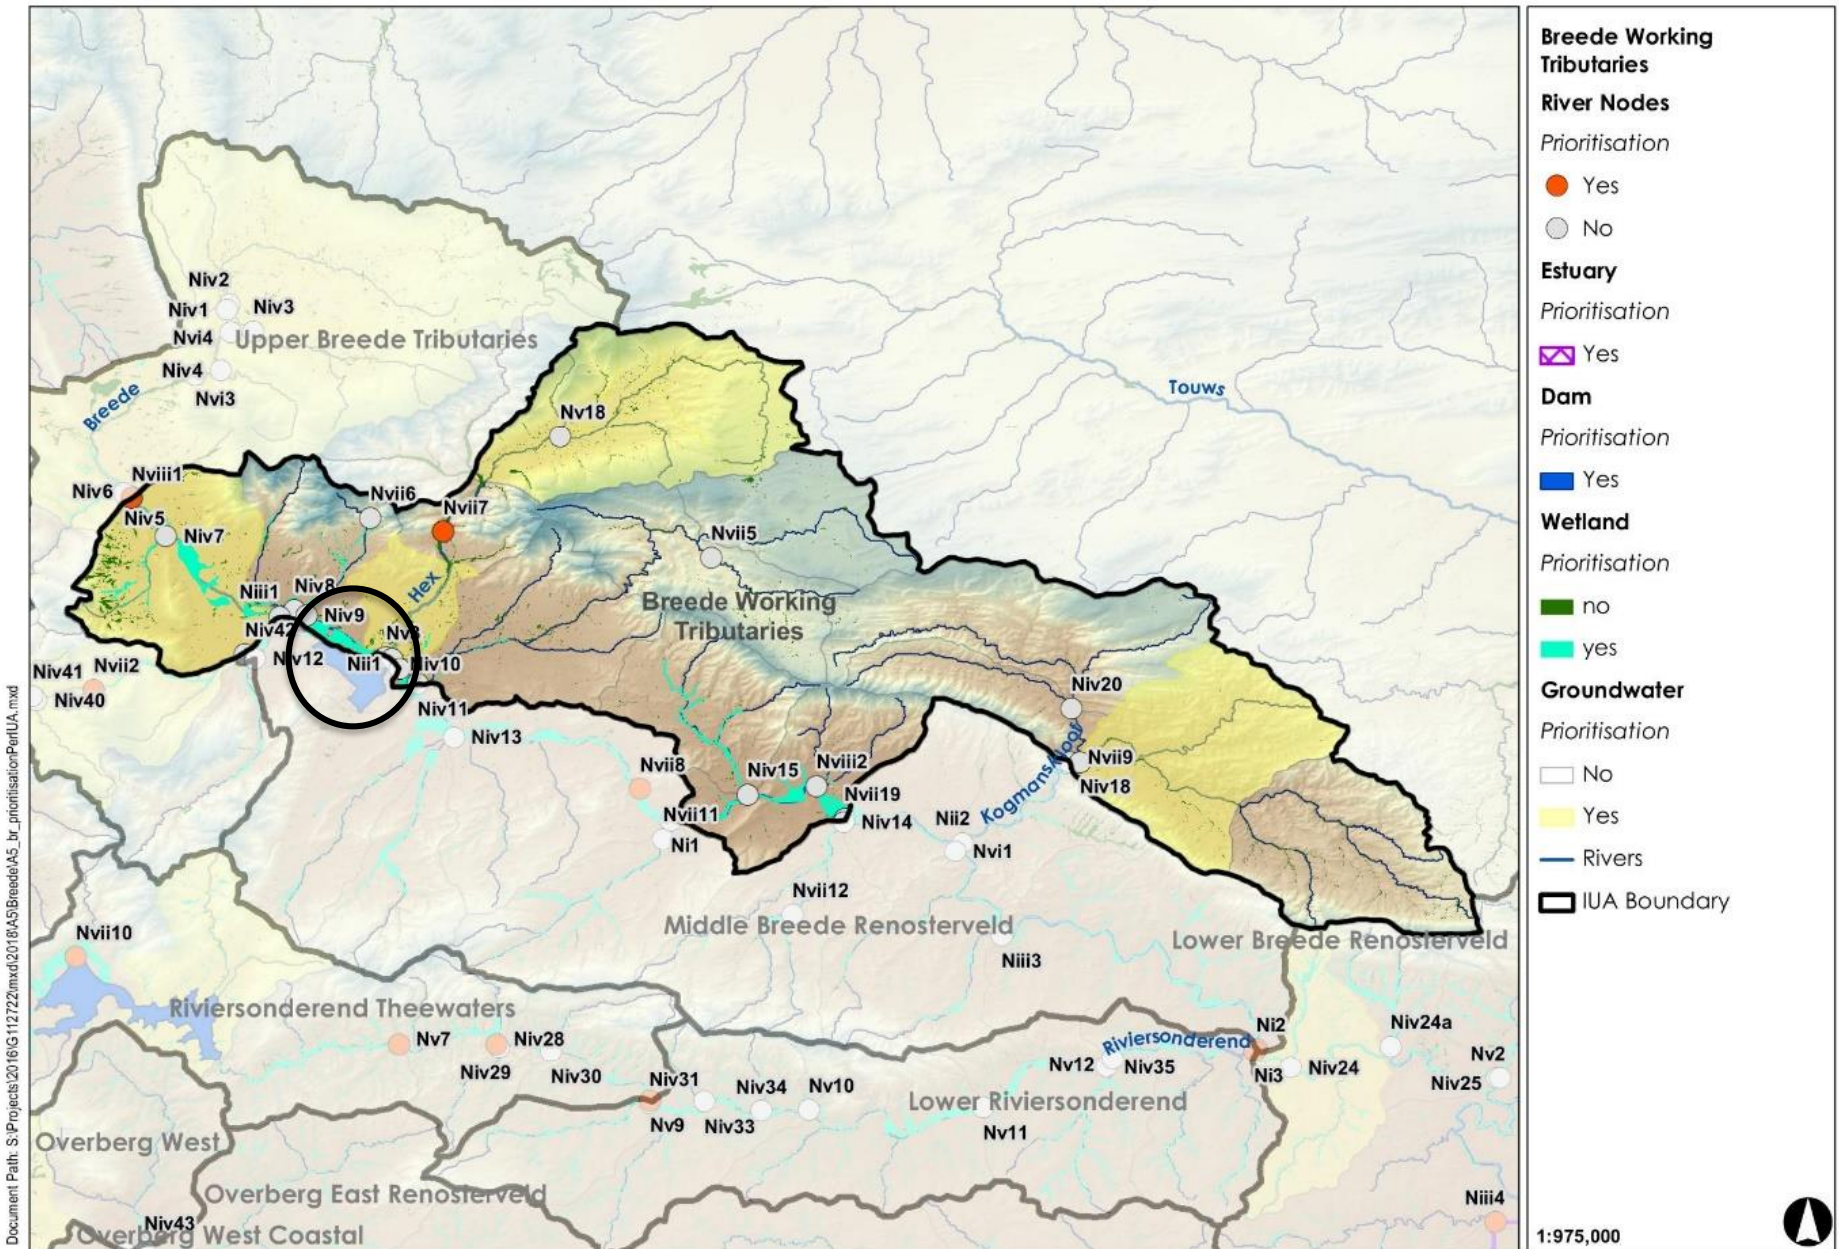

Greater Brandvlei Dam

(IUA A2 Breede Working Tributaries)

- Largely an off-channel dam (impounds small lower Brandvlei River) with limited natural inflow, and limited farm dams located upstream. During the dry season significant irrigation releases are made.
- The important Papenkuils floodplain wetland is located just upstream of the dam, below the canal off-takes from the Smalblaar and Holsloot rivers.
- Water in the dam is mainly used for irrigation along the Breede River and for urban and rural use. Irrigation water is distributed by a system of canals receiving water directly from the dam as well as pumps and canals abstracting released water downstream.
- significant recreational activities include abseiling, sailing, kayaking and fishing, among others.

Greater Brandvlei Dam (IUA A2 Breede Working Tributaries)

Greater Brandvlei Dam

(IUA A2 Breede Working Tributaries)

Sub-comp.	Rationale for sub-component choice	Indicator selection
Low flows	Dam levels must remain sufficient to make releases for irrigation, as well as releases for ecosystem function downstream.	EWR
Nutrients	The system must be maintained in an oligotrophic state.	Ortho-phosphate, nitrogen, ammonium
Salts	Salt levels must be maintained at concentrations where they do not impact negatively on the ecosystem.	Electrical conductivity
Fish	The wellbeing of the fish community of this artificial ecosystem must be maintained in a suitable condition to contribute to regional biodiversity and to support local recreational angling industry. The re-infestation of alien species from the dam should be prevented. Consumption of fish must not pose a health risk.	Implementation of the Index of Reservoir Habitat Impairment (IRHI) by Miranda and Hunt (2011), fish health evaluation

Quantity & Biota RQOs for Greater Brandvlei Dam

H16 Overberg West Coastal	WR2 Coastal Southern Folded	Southwest Sand Fynbos Channelled Valley Bottom	Bot-Kleinmond Estuary	x	
		Wetlands within Strategic Water Source Areas	N/A		x
H17 Overberg East Fynbos	WR4 Coastal Sediments	Southwest Ferricrete Fynbos Flat, Depression and Floodplain	Agulhas Wetland System	x	x
		East Coast Shale Renosterveld Floodplain	De Hoop Vlei	x	

Note: Although HIGH priority wetlands have been identified, these may be considered a representative sample of wetlands in the Breede-Gouritz WMA. All wetlands are still to be considered under the National Water Act for triggering activities, and will need to be assessed fully. The benefit of identifying HIGH priority wetlands is to identify a representative sample of wetlands whereby further information is required, or where information is available to ensure that monitoring occurs.

Resource Unit Prioritisation – Gouritz-Coastal

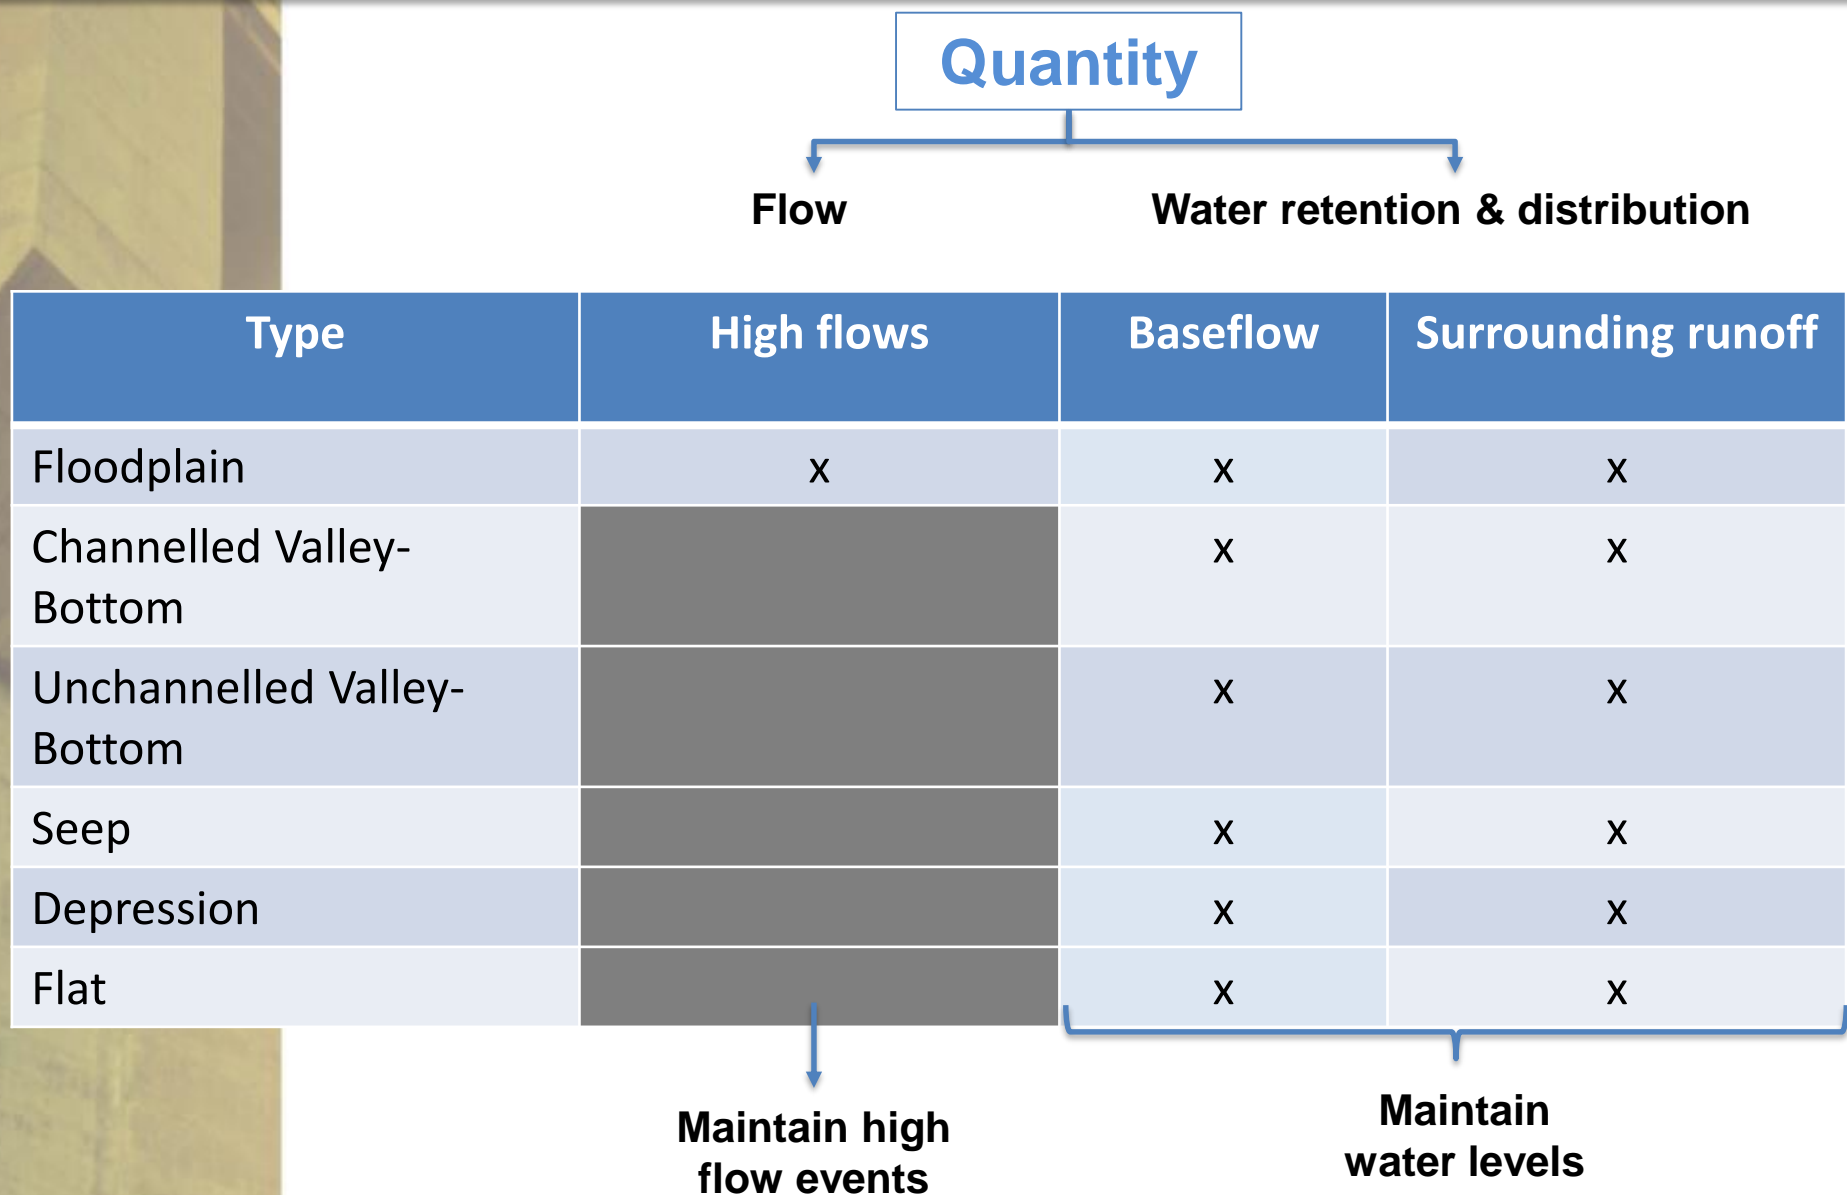

IUA	Wetland Region	Wetland Resource Unit	Name	Ecol NB	Supply
C6 Great Karoo	WR6 Great Karoo	Lower Nama Karoo Depression	N/A	x	x
D7 Touws	WR7 Cape Fold Swartberg	Wetlands within Strategic Water Source Areas	N/A		x
G15 Coastal	WR10 Sedimentary Coastal Lakes	Freshwater Lake	Groenvlei	x	x
		Freshwater Lake	Wilderness Lakes	x	x
	WR11 South East Coastal	Wetlands within Strategic Water Source Areas	N/A		x
F13 Lower Gouritz	WR3 Southern Coastal	Albany Thicket Floodplain	Gouritz River	x	x
F12 Duiwenhoks	WR3 Southern Coastal	East Coast Shale Renosterveld Channelled Valley Bottom	Goukou Wetland	x	x
		East Coast Shale Renosterveld Channelled Valley Bottom	Duiwenhoks Wetland	x	x

- The steps for evaluation were:
 - Developed a conceptual model of:
 - **Wetland hydrological functioning and geomorphology**
 - Wetland vegetation
 - Wetland water quality amelioration
 - Important wetland biota
 - Validation and site selection (required as part of monitoring)
 - Monitoring should take account of the relevant RQO and if required develop a baseline of Wetland Health

BASELINE

Characteristics of different Wetland Types

Evaluation: Duiwenhoks Wetland

			Comp onent	Sub- compo nent	Indicator	Conceptual functioning		Baseline monitoring
F12	Southern Coastal (WR3)	East Coast Shale Renosterveld Unchannelled and Channelled Valley Bottom (Duiwenhoks)	QUA NTITY	Flow	Monitor active erosion sites and density of alien invasive plants (especially <i>Acacia mearnsii</i>).	Unchannelled and Channelled-valley bottom wetland. Retention of water is important, particularly for unchannelled valley bottom wetlands. This is under threat by the concentrated flows through the erosion donga.	Upper Duiwenhoks is within the Southern Fold Wetland Region (WR), but where river flows into flatter coastal belt. Deposition of alluvium derived from steep mountainous streams, and associated vegetation growth on alluvium, resulted in extensive Valley-Bottom wetlands. The Duiwenhoks historically would have been characterised by unchannelled and weakly channelled Valley-Bottom wetlands dominated by Palmiet and Phragmites vegetation. Although the upper-western part of the wetland remain relatively intact, there is still evidence of invasive alien plants and most importantly an actively eroding donga. This erosion has resulted in reduced flows on the wetland and altering flows through berms/drains/roads have caused increased flow.	Working for Wetlands have been working in the area since 2006 (2008, 2009, 2015). Alien invasive plants have been removed, and follow up removal is conducted annually. Work has been done to stabilise the erosion donga.

Evaluation: Duiwenhoks Wetland

East Coast Shale
Renosterveld
Channelled Valley
Bottom
(Duiwenhoks)

Component	Sub-component	Indicator/ measure	RQO	Numerical limits
QUANTITY	Water distribution and retention patterns	Flow concentration	Active erosion concentrates flows and increases the rate of flow movement through the wetland. This concentration of flows needs to be managed to ensure that water distribution still occurs across the wetland.	Every three years: Map erosion features in the wetland and monitor whether the wetland is drying out near the erosion feature.
	HABITAT	Geomorphology	Erosion	Active erosion removes sediment and vegetation from the wetland. The erosion of banks and headcuts need to be managed in order to reduce habitat removal.
	HABITAT	Wetland vegetation	Alien invasive plants	Alien invasive plants, particularly <i>Acacia mearnsii</i> , affect the water distribution and cause bank erosion. The density of alien invasive plants need to be managed, especially in the vicinity of active erosion areas.

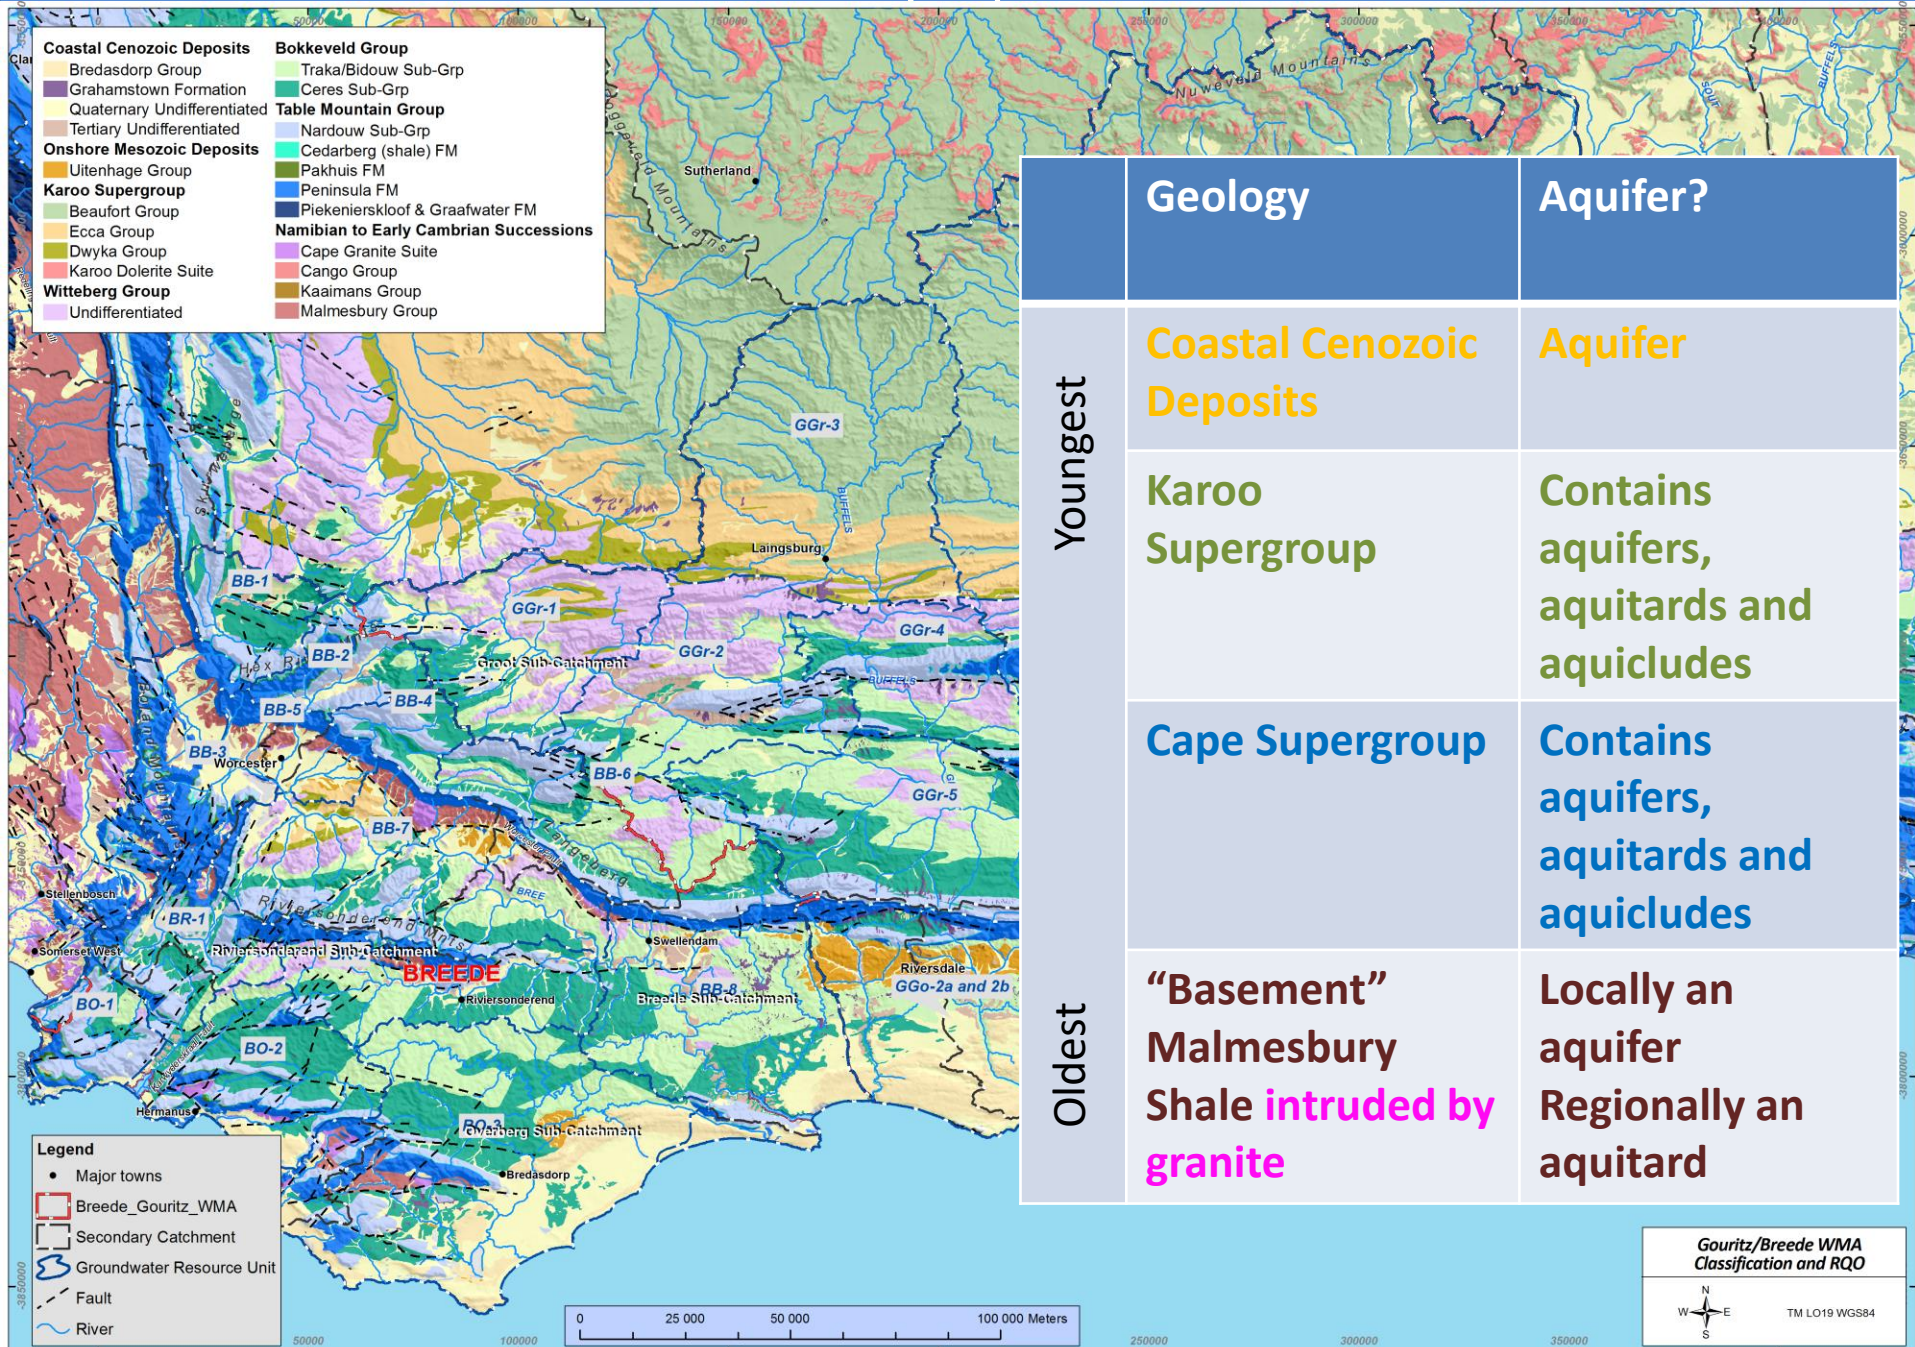

Groundwater

1. Key aquifers in the Breede-Gouritz WMA
2. Evaluating groundwater status
3. Relationship between groundwater status and EWRs
4. Impacts of scenarios on groundwater
5. Future groundwater status
6. RQOs for priority groundwater resource units (example)
7. Monitoring programmes for groundwater (example)

1. Key aquifers

2. Evaluating groundwater status

- Status quo and EWR report included analysis of current groundwater situation:
 - Groundwater quality, groundwater levels, analysis of trends in both of these
 - Development of groundwater balance model quantifying recharge, groundwater contribution to baseflow, current groundwater use, remaining groundwater availability
 - Identification of areas critical for groundwater use for domestic supply, agricultural supply, and for GW-SW interactions
 - Present status related to use based on stress index (use / recharge)

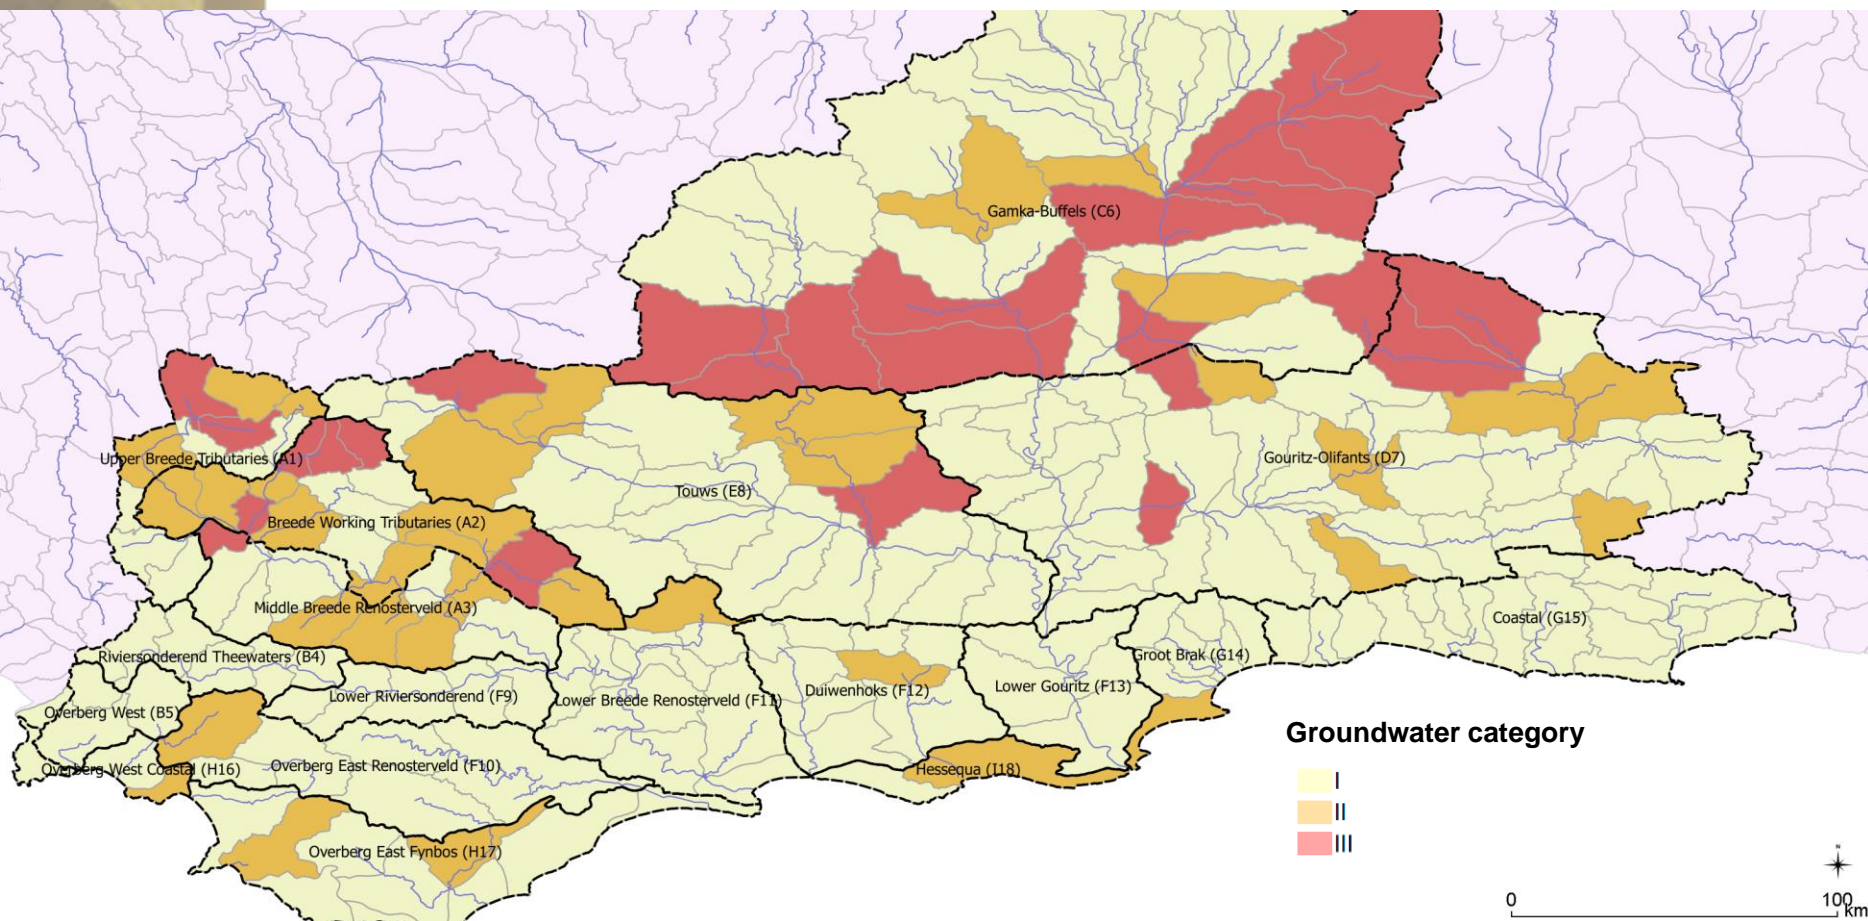

3. Relationship between groundwater status and EWRs

- The above relationships may well be widely accepted, and are theoretically acceptable, but implementation challenges remain
 - simplifying assumptions required to implement the theory,
 - scale complexities,
 - data availability,
 - varying hydrogeological terrains across SA,
 - integration between disciplines (data, models, scales)
 - modelling methods & challenges.

4. Impacts of scenarios on groundwater

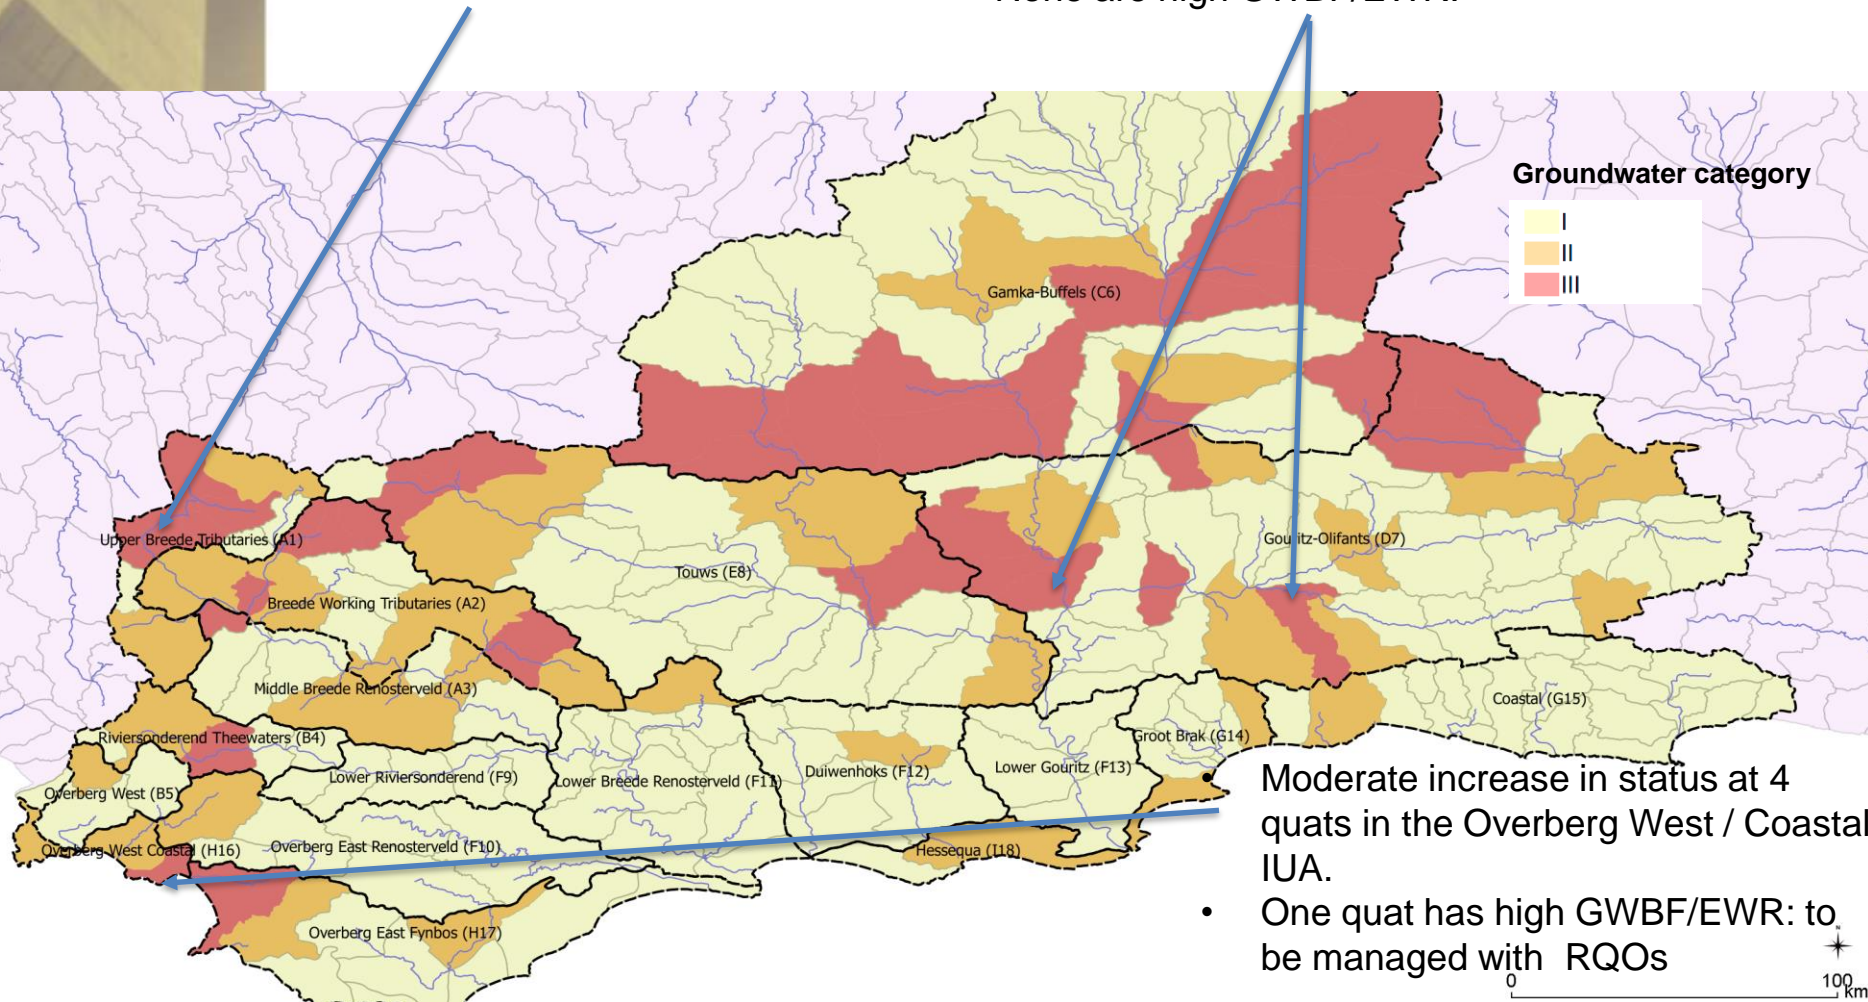

Present status

4. Impacts of scenarios on groundwater

- Increase in status at 4 quats in the Upper Breede Tributaries IUA.
- 2 of these have significant increase.
- None are high GWBF/EWR.

- Moderate increase in status at 7 quats in the Gouritz-Olifants IUA.
- 4/7 change from I to III
- None are high GWBF/EWR.

Moderate increase in status at 4 quats in the Overberg West / Coastal IUA.

- One quat has high GWBF/EWR: to be managed with RQOs

5. Future groundwater status

PES – Baseline:

- Total groundwater use 215 million m³/a

Future Growth – NoEC:

- Total groundwater use 293 million m³/a
- Increase in groundwater use 36%

ESBC – Bottom line:

- Total groundwater use 338 million m³/a
- Increase in groundwater use 57%

Spatially targeted:

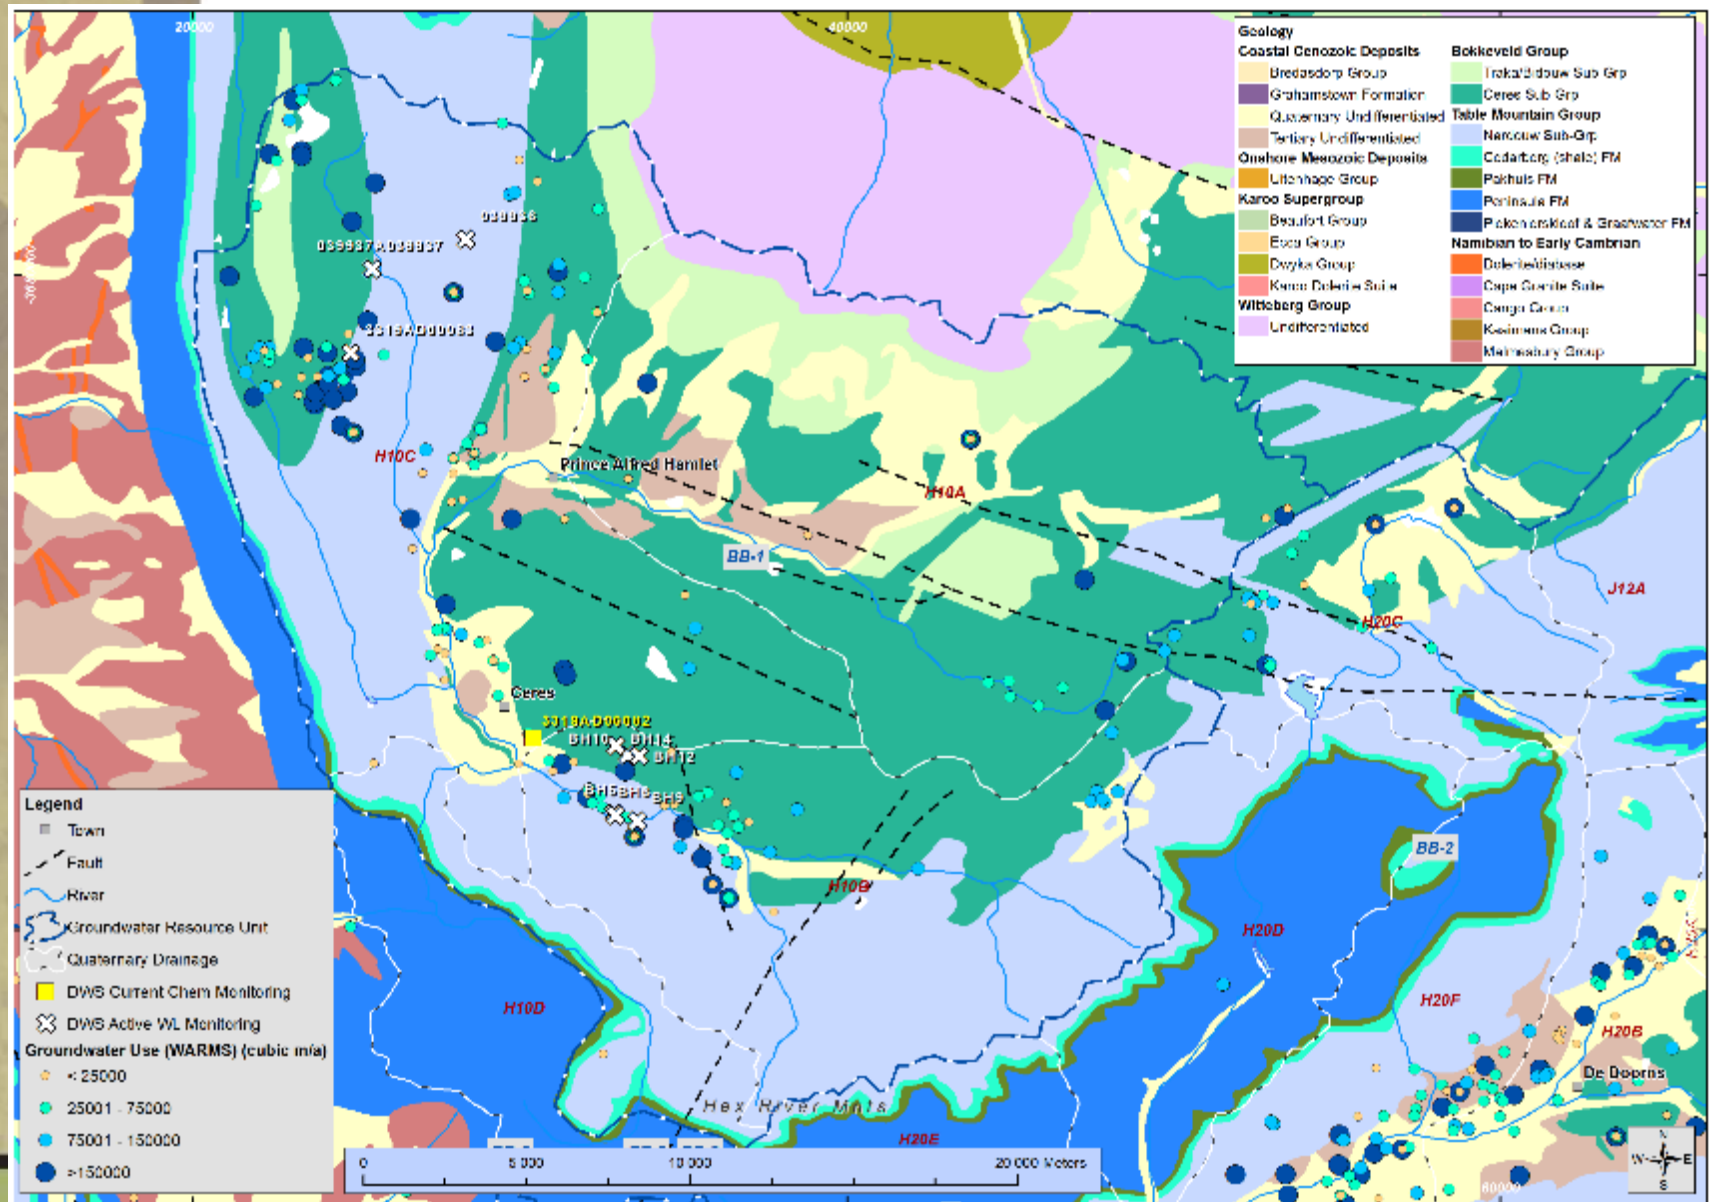

- Total groundwater use 429 million m³/a
- Increase in groundwater use 99%

REC:

- Total groundwater use 482 million m³/a
- Increase in groundwater use 124%

Management considerations

Prioritisation sub-criteria

Criterion	Weights (%)	Sub-criteria	Weights (%)	Rating guidelines
Importance for users	25	RUs most important in supporting 'sole-supply' settlements	60 (15 points)	0 – RUs which do not support sole-supply settlements
				0.5 – RUs supporting some sole-supply settlements (1-2)
				1 – RUs supporting several sole-supply settlements (>2)
		RUs within strategic water source areas for groundwater (high groundwater availability & strategic use)	20 (5 points)	0 - RUs outside of SWSA-gw
				1 – RUs within SWSA-gw
		RUs most important in supporting activities contributing to economy (GDP, job creation) (e.g. commercial agriculture, industrial abstraction, bulk abstraction by water authorities)	20 (5 points)	0 – RUs which do not directly support any activities which contribute to economy [as indicated by $<0.05\text{l/s/km}^2$]
				0.5 – RUs which moderately support activities which provide a contribution to economy [as indicated by $0.05\text{-}0.1\text{l/s/km}^2$]
				1 – RUs which significantly support activities which contribute to the economy [as indicated by $>0.1\text{l/s/km}^2$]

Prioritisation sub-criteria

Criterion	Weights (%)	Sub-criteria	Weights (%)	Rating guidelines
Level of surface water – groundwater interaction	30	Relevance of groundwater contribution to maintain required low flow conditions	50 (15 points)	0 – RUs without relevant groundwater contribution (low GWBF/EWR) (GWBF/EWR < 11%)
				0.5 – RUs where groundwater contribution supports low flow condition (GWBF/EWR moderate, 12-75%)
				1 – RUs where groundwater contribution is crucial to maintain low flow condition (GWBF/EWR high >75%)
		Relevance of groundwater contribution to maintain priority groundwater-dependent ecology	50 (15 points)	0 – RUs without priority groundwater-dependent systems (estuaries / wetlands)
				0.5 – RUs with some priority groundwater-dependent systems (estuaries / wetlands) (<200ha)
				1 – RUs with significant area of groundwater-dependent systems (estuaries / wetlands) (>200ha)

Prioritisation sub-criteria

Criterion	Weights (%)	Sub-criteria	Weights (%)	Rating guidelines
Threat posed to users	30	Medium to Long-term declining trend in water or piezometric levels	35 (10.5 points)	0 – RUs where no trend is visible
				0.5 – RUs where short-term trend is potentially visible, or minor
				1 – RUs where long-term trend is visible, or where no data is available to assess trend
		Medium to Long-term declining trend in natural water quality	35 (10.5 points)	0 – RUs where no trend is visible
				0.5 – RUs where short-term trend is potentially visible, or minor
				1 – RUs where long-term trend is visible, or where no data is available to assess trend
		Presence of high stress category (currently)	15 (4.5 points)	0 – RUs where stress is low (category I)
				0.5 – RUs where stress is moderate (category II)
				1 – RUs where stress is high (category III)
		Presence of high stress category (future)	15 (4.5 points)	0 – RUs where stress is low (category I)
				0.5 – RUs where stress is moderate (category II)
				1 – RUs where stress is high (category III)

Prioritisation sub-criteria

Criterion	Weights (%)	Sub-criteria	Weights (%)	Rating guidelines
Practical Considerations	15	Availability of water quality monitoring data (WMS monitoring boreholes) located within RU?	50	0 – RUs where no resource quality information exists
				0.5 – RUs for which a moderate level of resource quality information exists (1-4 points)
				1 – RUs for which there is a good availability of resource quality information (>4 points)
		Availability of water level monitoring data (DWA monitoring boreholes) located within RU?	50	0 – RUs where no water level information exists
				0.5 – RUs for which a moderate level of water level information exists (1-4 points)
				1 – RUs for which there is a good availability of water level information (>4 points)

Evaluation of RUs - method

- Customised DWS **RU Evaluation Tool** used to identify selected indicators *for prioritised RUs* for which RQOs (descriptive and numerical) will be written, by identifying:

Components

Sub-components

Indicators

Evaluation of RUs - method

The **evaluation criteria** (applied in the **RU Evaluation Tool**) for each of the above indicators are:

- **Cumulative level of impact**: This is the anticipated level of impact of current and future use/activities in the upstream catchments on the inflows to the dam and the quality, habitat and biota in the dam
- **Protection of the Resource**: Rating of importance of components for the protection of the water resource, i.e. importance to releases of water for downstream EWRs
- **Water Resource Dependent Activities**: Rating of importance of components for protection of in-dam activities and releases of water for downstream use (irrigation, domestic/rural supply, etc.)

Components with importance scores of 0.5 and higher were selected

Outline of RQOs - method

- Targeted Ecological Category (TEC) = Spatially Targeted Scenario, where info is available
- For the High Priority Rus:
 - Evaluate present status and suitability of data
- For the selected sub-components and indicators of each dam:
 - Write descriptive RQOs (narratives)
 - Set numerical limits
 - Set Thresholds of Potential Concern (TPCs)

BB-1

Resource Unit Evaluation

Component	Sub-component	Reason for selection	Example of indicator
QUANTITY	High flows	Floodplain wetlands require high flow events in order to overtop banks.	River flow RQOs are given as monthly average volumes (MCM) that include maintenance low and high flows combined.
	Water retention and distribution patterns	In certain wetlands channelized flow is not as important as the retention of water. In order to maintain wetland functioning water needs to be retained and distributed, often with seasonal fluctuations.	Wetlands have a dynamic hydrology varying daily, seasonally and annually. Due to this dynamic nature it is difficult to define the frequency and duration of water retention and distribution. An approach to define prolonged saturation up to the temporary zone relies on defining the wetland plants and wetland soils.
QUALITY	Nutrients System variables (temperature, salinity, oxygen, pH, turbidity) Pathogens	WQ influences habitat quality for organisms and also fitness for use for users	Specifications for maximum and minimum level for key properties of and contaminants in water
HABITAT	Geomorphology	The relationship of water and sediment creates a stable equilibrium for a wetland. Any change to this equilibrium will push a wetland into a vulnerable state of either aggradation (sediment deposition) or degradation (sediment removal).	Sediment accumulation
	Vegetation	Wetland vegetation is an important indicator of a wetland boundary. Alien invasive vegetation encroachment into a wetland may result in reduction of water distribution and push the wetland into a vulnerable state geomorphically.	Wetland vegetation integrity versus alien invasive vegetation
BIOTA	Frogs	NFEPA frog species live in wetlands and require the “stepping stone” habitats that wetlands provide.	Community composition and abundance of frogs
	Birds	Important bird species live in or near wetlands and depend on the wetland habitat.	Community composition and abundance of birds

Resource Unit Evaluation

Component	Sub-component	Reason for selection	Example of indicator
QUANTITY	Low flows	Component selected as part of original Reserve baseline information and standard for measuring all other ecosystem responses	Flow RQOs given are a monthly average volumes (MCM) that include maintenance low and high flows combined i.e. they include the inter-annual floods with a return period greater than 1:2 years
	High flows		
QUALITY	Nutrients	WQ influences habitat quality for organisms and also fitness for use for users	Water quality fitness-for-use categories, ranging from Ideal, Acceptable, and Tolerable. If in Unacceptable category the quality should be improved to a Tolerable category. Limits are specified for the different categories, for different uses.
	Salts	High salt concentrations affect crops yields, unpalatable drinking water, and interferes with the osmoregulation of aquatic organisms.	
	System variables (temperature, salinity, oxygen, pH, turbidity)	System variables such as pH, water temperature, suspended sediment, affect aquatic biota and uses.	
	Toxic substances	Agrochemicals (pesticide & herbicides residues) can have chronic or acute impacts on aquatic biota.	Conservative approach followed, no agrochemicals present in water.
	Pathogens	Water-borne diseases negatively affect domestic water supplies.	Fitness for use categories for domestic water supply and contact recreation.
HABITAT	Index of Habitat Integrity	Provides an overall score for ecological condition.	Scores are ranked as:
	PAI	Provides a score for the water quality condition.	A natural
	GAI	Instream habitat influences aquatic biota. Riparian habitat influences river channel structure and also protects agricultural land from erosion and provides habitat to riparian organisms.	B near natural C moderately modified with natural functions still in place
	FRAI	Provides a score for the fish condition (see below).	D moderately modified with a loss of natural functions
	VEGRAI	Provides a score for the vegetation condition (see below).	E severely modified
	MIRAI	Provides a score for the macroinvertebrate condition (see below).	F critical modified with a total loss of biota and function
BIOTA	Fish	Indigenous fish are of conservation importance	Catch per Unit Effort (CPUE) of fish species present. Frequency of occurrence (FROC) of key fish species.
	Aquatic and Riparian vegetation	Riparian habitat influences river channel structure and also protects agricultural land from erosion and provides habitat to riparian organisms	% cover of indigenous and riparian plant species.
	Macroinvertebrates	Invertebrates provide a useful measure of aquatic biodiversity and also are indicators of water quality.	SASS and ASPT scores from SASS. The number of macroinvertebrate families present. Presence of key families.
	Aquatic and Riparian vegetation	Riparian habitat influences river channel structure and also protects agricultural land from erosion and provides habitat to riparian organisms	% cover of indigenous and riparian plant species.

- WR4: Coastal Sediments
- WR3: Southern Coastal

High flow events: FLOODPLAINS

Ollis et al. 2013

Limited infiltration/groundwater inflow (Baseflow)

- Generally receive most water during high flow events when waters overtop the streambank.
 - NB flood attenuation because of the nature of vegetation and topographic setting. Flood attenuation is likely to be high early in the season until the floodplain soils are saturated, whilst in the late season flood attenuation is reduced.
 - As flood waters overtop streambanks the waters drop sediments, and nutrient bound sediments, which are left behind to accumulate.
- The nature of clayey soils in floodplains means that soils retain water, thus limiting contribution to streamflow and groundwater recharge.

Water retention & distribution: ALL

Quantity: Flow/Water retention & distribution

DWAF, 2009
